## The Complete Control Loop Market Leader

Across thousands of individual solutions and spanning dynamic conditions of global competition our mission is to work towards your success.

We have decades of global experience and we have always been positioned at the forefront of sensor technology.

Our innovative approach to your success is to secure your process efficiency, lower your downtime, increase your safety and boost your competitive advantage.

We intend to collaborate with you where we can share our control loop experience.

All of our combined knowledge is available to you through consultation, engineering support, selection and commissioning.

Everyone in our organization is interested in listening to you with the aim of presenting you with only the most appropriate solution fluently in your daily application language.

З

## Welcome to the Fascinating World of Fluid Control Systems

Measurement and control: When it comes to working with liquids and gases, we are at your side - as a manufacturer of sophisticated products, as a problem-solver with an eye for the big picture, and as a partner offering you reliable advice. Since we started in 1946, we have developed into one of the world's leading suppliers of Fluid Control Systems. At the same time we have kept our status as a family-owned business with a foundation of strong basic values to highlight the way we think and act.

## Bürkert Product Program

We are one of the few suppliers on the market to cover the complete control loop. Our current product range extends from solenoid valves through process and analytical valves to pneumatic actuators and sensors.

## EXPERIENCE

There are things which are not inherently yours. You have to gather them bit by bit. You receive them from others. And you constantly have to acquire them anew. That is what makes them so valuable. Experience is one of those things. For instance, because of our many years of experience with metering, controlling and analysing of fluids, we can provide our extensive services to you - from consulting, development, and 3D CAD simulating to testing and after-sales service. Whether individual product solutions or a pioneering new system for the entire control process: Benefit from our experience!

## COURAGE

0

0

Those who only work toward optimizing things that already exist will eventually reach the limits - technically, financially, or personally. In order to overcome these limits, courage is needed: The courage to be different and trust one's own ideas; the courage to venture into the unknown, searching for new ways to develop products that have never existed before. We have this courage. By pooling and utilizing our competencies across all sectors, you benefit from our cumulative knowledge in metering of fluids - whether it is in water treatment, cooling or hygienic processing applications.

Bürkert offers a remarkable range of servo-assisted and direct acting solenoid valves. Read more about them in this brochure.

Bürkert offers unlimited modularity for process control with angle-seat, globe and diaphragm valves in the widest range of configurations.

The brochure contains an overview of Bürkert miniature valves and micro pumps, which allow for precise and safe handling of small volumes of liquids.

## **CLOSENESS**

There are things we simply take for granted. Only when they are gone, do we realize how important these things really were. This applies in particular to closeness. Without closeness, it is very difficult to build relationships and a good understanding of one another. As an established medium-sized company, we know that. And that is why we are always there for you. Working with you, we develop the best possible solutions for your projects. Our global presence in 35 locations enables us to press ahead with sensor innovations for our customers around the world.

5

Here you can find our product range of pneumatic valves, valve units and automation systems as well as information on our control cabinet building.

Here you can find our sensors, transmitters and controllers for measuring and controlling flow. temperature, pressure, level, pH/ORP and conductivity.

This brochure provides technical background information as well as a detailed product overview for the mass flow controller and meter product range

This brochure presents our solenoid control valves including their respective features, functions and typical applications.

## Providing Process Vision

For more than 20 years we have been providing our customers with sensors, transmitters and controllers where fit-for-purpose is optimized. At the same time our sensor range has become a key ingredient of our offer to complete the control loop and take care of your process headaches.

From the outset our clients, large and small, have appreciated the practical orientation, man-machine interface and architecture of the sensor range characterized by extremely simple installation, commissioning, calibration and teach functionality. Standardized layout, electrical interfaces, process connections. and, above all, intuitive menus, make the whole range simple to work with.

#### **Designed to Fit Our Clients Applications – Perfectly**

When we define quality as fit-for-purpose, Bürkert sensors prove their exceptional quality in all relevant applications. Wherever you need to display process values, perform control functions, monitor alarms to control flow rates, monitor leaks or control pH values Bürkert sensors make the difference.

Some industries constantly demand higher communication technology with fieldbus interfaces and multi-channel designs. Some examples are FDT/DTM and wireless while others exhibit an increasing demand for "simple" monitoring with switching output. We take care of both and, at the same time, we combine our sensor knowledge into innovative systems.

#### New Beautiful Design

ELEMENT is a complete system approach that allows you to solve process problems. It encompasses the total loop: valves, sensors and controllers in one beautifully simple architecture which can be relied on to monitor and control inert fluids, steam, corrosive solvents, chemicals or abrasive fluids in a wide variety of application environments. Combining the chemical characteristics of engineered polymers with the beauty and endurance of stainless steel, ELEMENT's platform is rugged and clean. There is no paint, no pockets, no pneumatic lines.

Bürkert's ongoing development to combine control and communications technology with process control hardware is unparalleled. ELEMENT surpasses industry standards in flexibility, simplicity and intuitive thinking. Each device is a joy to commission, calibrate and use.

## How to use this Brochure

Each measured process variable has information to help you choose the correct equipment for your purpose. In this brochure you will find technical principles, range overviews, features and selection help. Datasheets for each type are always available online at www.burkert.com.

# Accurate and Reliable Flow, Batch and Ratio

Flow monitoring and control is the foundation for the Bürkert sensor range.

In our factories we manufacture sensors (with raw signal output) and transmitters (with 4-20mA output) for a wide variety of customers around the world.

Liquid flow measurement is made by a wide range of principles which are explained in more detail on the next few pages but are composed of paddle wheel, magmeter, oval gear, ultrasonic and differental pressure.

Each type of sensor fits inside an architecture arranged around common interfaces and communication structures. They are characterized by similar menus, displays, totalizers, teach-in and volumetric calibration functions. Standard industry voltages, certifications, norms, and factory calibration certificates are always available. Materials such as PEEK, ceramics, and PVDF are used to ensure long life and chemical compatibility.

Flow expertise combined with our valve history is a perfect match for simple and accurate batch control and fast acting ratio control. The interface with our valves is designed to be as simple as possible and complete PID flow loops can be made with just two components.

We Make Ideas Flow.

# Measuring Principles

Paddle wheel sensors may be differentiated by the material used for the paddle wheel (plastic or stainless steel) or on the basis of signal detection/evaluation (coil sensor, HT coil sensor, Hall sensor or optical sensor). This results in 4 different paddle wheel versions whose principles are described here.

#### Plastic paddle wheel (PVDF or PP) with inductive detection and pulse output

A PVDF or PP paddle wheel with four molded permanent magnets in the arms rotates on a precision, wear resistant ceramic spindle and two ceramic bearings. A Hall sensor detects the magnetic field of the rotating paddle wheel is placed outside of the fluid area. Two output signals are generated per revolution and the frequency changes proportionally with the speed of rotation of the paddle wheel. An integrated electronics board converts this signal to a square-wave frequency signal.

#### Plastic paddle wheel (PVDF or PP) with inductive detection and sinusoidal output

A PVDF or PP paddle wheel with four molded permanent magnets in the arms rotates on a precision, wear resistant ceramic spindle and two ceramic bearings. A coil with a ferrite core, detecting the magnetic field of the rotating paddle wheel, is placed outside of the fluid area. The frequency and voltage change in proportion to the rotational speed of the paddle wheel and two positive signals are generated per revolution. The rotation of the paddle wheel generates a sinusoidal voltage signal in the coil proportional to the flow rate. This sensor is two-wire and requires no additional auxiliary energy supply. A connected, batteryoperated display unit allows operation independent of mains voltage.

Plastic paddle wheel (PVDF) with optical detection and pulse output

The paddle wheel is made of PVDF material and the spindle and two bearings are made of wear-resistant ceramic material (Al<sub>2</sub>O<sub>2</sub>). Two infrared transmitters (IR) and receivers are placed in the electronics housing outside of the medium area, separated by plastic which allows infrared radiation to pass through it. The rotation of the paddle wheel is detected with these IR diodes and the integrated electronics converts the reflected IR-Signal to a square wave frequency signal, proportional to the flow rate. This optical method allows the flow rate to be detected in media with ferromagnetic particles and to detect the direction of the flow.

#### **Output signal**

#### **Output signal**

#### Stainless steel paddle wheel with inductive detection and pulse output

This paddle wheel consists of stainless steel with very low ferromagnetic characteristic. The spindle is made of a hightech ceramic or stainless steel and the bearing is made of PEEK or ceramic. Inside the top-mounted electronics is a HT coil with permanent magnets and electronics which converts the coil signal into a square wave frequency signal proportional to the flow rate. The frequency changes in proportion to the speed of rotation of the paddle wheel. Two positive output signals are generated per revolution. This method is particularly used for media with temperatures up to 160°C (320°F). Ferromagnetic particles and contaminants in the fluid do not restrict the range of application.

Plastic paddle with magnetic detection and switch output

A permanent magnet is integrated into a paddle. The paddle is able to turn on a stainless steel spindle in the flow crosssection and is in vertical position if there is no flow. A reed contact is positioned above the paddle outside the medium area in the electronics housing. If a specific flow velocity is exceeded, the paddle is deflected in flow direction and switches the reed contact. The switching point can be set for increasing and decreasing flow velocities by means of an adjusting screw. The devices are available in the following versions:

- Normally open (NO).

The flow closes the contact.

Normally closed (NC).

The flow opens the contact.

Volumetric flow measuring: oval gear with inductive detection and pulse output Two toothed oval rotors, mounted perpendicular to the flow direction in a special housing, are forced to rotate by a flowing fluid. Each rotor transmits fluid from inlet to outlet and forms a closed compartment when its major axis is aligned with the main flow direction. The volume passed per revolution of each rotor is four times the volume between the rotor and the oval housing when the rotor is confining liquid. Two small permanent magnets positioned in one of the oval gears are used to detect the rotary movement. A Hall sensor which detects the magnetic field of the oval gear and generates two square-wave output signals is placed outside of the medium area in an electronics housing. The number of pulses is directly proportional to the number of chamber volumes pumped and therefore making this method particularly suitable for flow measurement of viscous media even at high pressure.

## Measuring Principles - Non Moving Parts

#### Magnetic inductive flow meters

Magnetic inductive flow meters, also known as magmeters, obtain the flow velocity by measuring the changes of induced voltage of the conductive fluid passing across a controlled magnetic field. Magmeters may be designed as full bore magmeters or insertion magmeters.

#### **Insertion magmeter**

An Insertion finger sensor element is mounted on one wall side and is in contact with the fluid. An electric coil which is placed near the top of the finger generates a constant alternating magnetic field B in the flow path. According to Faraday's law of electromagnetic induction, a conductive fluid passing across the magnetic field induces a current flow between the 2 electrodes which can be measured as a voltage. The 2 electrodes are placed at the tip of the flow finger. The higher the flow speed v, the higher the created voltage. Integrated electronics convert the voltage signal into a standard signal (e. g. 4 - 20 mA or pulse).

The design of the Insertion magmeter is very compact and can also be easily installed into existing pipe systems. Insertion magmeters are suitable for flow measurement of virtually all conductive fluid media – even with a high level of contamination. Only non-conductive fluids <20  $\mu$ s, coating type liquids or highly abrasive fluids restrict application options. Due to the fact that only one point of the pipes cross section is used to measure the fluid velocity, the accuracy is slightly less then that of a full bore magmeter.

#### Full bore magmeter

Two electrical coils are placed around the pipe of the flow to be measured and sets up a pair of electrodes across the pipe wall. The two coils generates a constant and homogeneous alternating magnetic field in the flow cross section. According to Faraday's law of electromagnetic induction, a conductive fluid passing across the magnetic field induces a current flow between the 2 electrodes which can be measured as a voltage. The higher the flow speed v, the higher the created voltage. Integrated electronics converts the voltage signal into a standard signal (e. g., 4 - 20 mA or pulse).

For the full bore magmeter, the induced voltage is detected by electrodes, which are arranged directly opposite of each other measuring the induced voltage of the entire pipe cross section. The advantage is that the entire flow profile can be detected. This results in very precise measurement of the medium velocity. Only non-conductive fluids <5  $\mu$ s, fluids causing coatings or highly abrasive fluids restrict application options.

#### Ultrasonic flow meter

A pair of transducers each working as a receiver or transmitter, are placed in the wall pipe with a specific distance (L) Both transducers send out an acoustic wave signal at the same time to the downstream and the upstream receiver. The signals are reflected by 2 mirrors; one on the upstream side of the pipe and the other on the downstream side of the pipe. The traveling time of both signals is measured by an integrated electronic board. The time for acoustic waves to travel from the upstream transducer 1 to the downstream transducer 2 is shorter than the time it requires for the same waves to travel from the downstream to the upstream. The difference in traveling time is directly proportional to the flow speed (V). The larger the difference, the higher the flow velocity. With this measuring principle it is possible to measure all kinds of water based fluids with a turn down ratio of up to 1:250. Conductive as well as non conductive fluids can be measured without any problems and having no moving parts means the maintenance costs are negligible.

1 /

#### Differential pressure flow meter

Differential pressure flow meters employ the Bernoulli equation that describes the relationship between pressure and flow velocity.

A flat orifice plate with an opening is inserted into the pipe and placed perpendicular to the flow stream. As the fluid passes through the orifice plate, the restricted cross section area causes an increase in velocity and decrease in pressure. The pressure difference before and after the orifice plate is used to calculate the flow velocity. The larger the pressure difference, the higher the flow velocity. The turn down ratio between smallest and highest measurable flow is about 10:1. Conductive as well as non conductive fluids can be measured without any problems. Having no moving parts, the maintenance costs are negligible. The measurable liquids can vary between clean, dirty and viscous fluids. Depending on the orifice plate size, it may be necessary to filter the fluid.

## Batch Controller Features

Bürkert batch controllers can control very precise dosing and filling operations. Two switching relay outputs serve to actuate valves for a single or double stage, precise dosing function. If required, one of the relays can be used as an alarm output in the event of an incomplete batch event. The dosing operations can be started manually or automatically. The design and materials allow use in virtually all types of fluids. It is possible to select the most appropriate measuring principle (paddle wheel, oval gear, ultrasonic, full bore magmeter or Insertion magmeter) depending on the properties of the medium. Selection tables, measuring principles and further information on selecting the appropriate sensor/fitting can be found in chapter 1: Flow measuring.

#### Type 8025/8035

The compact version, type 8025 or 8035, combines a paddle-wheel flow sensor and an electronic module with a display in an IP65/ NEMA4 enclosure.

#### Type 8025

The remote version consists of an electronic module 8025 integrated in a front-over or integrated in an IP65 enclosure. The associated separate flow sensor should have a pulse output signal, like Bürkert sensor Type 8020, 8030... (see interconnection chart) or another flow sensor available from the market. The output signals are provided on a terminal strip.

#### Full bore magmeter 8051/8054/8055/8056

The full bore magmeter, 8051/8054/8055/8056, is available as remote or compact version in an IP67 enclosure. For highly precise and fast filling/dosing in hygienic applications, it is the batch controller of choice.

The following dosing and filling operations are possible with the 8025/8035 batch controllers:

- Local dosing: the user enters the quantity to be metered and initiates the dosage from the keypad.
  Local dosing with pre-set quantity: the user selects up to 7 pre-set volumes and initiates the dosage
- Local dosing with pre-set quantity: the u from the keypad.
- Remote control dosing using a 7 positio inputs.
- Dosing controlled by a PLC unit using 3 binary data inputs for up to 7 preselected volumes.Automatic dosing controlled by variation of pulse duration. The quantity of the dosing is directly
- Automatic dosing controlled by variation pro-portional to the duration of a pulse.

- Remote control dosing using a 7 position rotary knob (selecting a pre-set quantity) or binary data

# Ratio Controller Features

The Bürkert 8611 ratio controller can very precise control the ratio between a main flow (Q1) and a secondary flow (Q2). Both are mixed together to a process flow Q3. The controller can handle 2 independent control loops. The following ratio control modes are possible:

**Dosing in relation to uncontrolled main flow Q1:** In relation to Q1, the secondary flow Q2 can be set as ratio to Q1 (%Q1).

**Dosing in relation to controlled main flow Q1:** In relation to the controlled Q1, the secondary flow Q2 can be set as a ratio to Q1 (%Q1).

For setting the main or secondary flow, the following control methods are possible:

- pump with 4-20mA signal (PUMP),
- solenoid control valves (SCV),
- process valves with 8810 positioning system (PCV) or
- any positioner with 4-20mA control signal (4-20).

For measuring the flow rate of Q1 and Q2, the following sensor types can be used: – sensors with frequency signal (FREQ),

- sensors with 0-10V (0-10) or 4-20mA (4-20) signal.

The set point and the ratio can be set external via standard signal (4-20mA or 0-10V) or directly by the keypad.

With the binary input (B IN), it is possible to activate different control functions like HOLD, open or close the valve etc. With 2 binary outputs, it is possible to define alarm signals.

## Selection Help – Flow

This table shows the measuring range of all flow meters depending on the flow technology.

## Selection Help – Flow Velocity Considerations

Depending on the sensor type, the right flow rate has to be chosen to get the best accuracy. The higher the flow velocity, the lower the measurement error, but the higher the pressure loss. On the next page you will find the relationship between flow velocity, pressure drop and accuracy (page 40-43). The following chart will help you find the correct fitting diameter for your application depending on flow velocity and sensor technology. Pipes for fluids similar to water are generally designed for an average flow velocity of approx. 2 to 3 m/s (6-10ft/s).

Flow rate

Diagram for nominal diameter selection

## Selection Help – Viscosity Considerations

Viscosity describes the degree of internal friction (the interaction between the atoms or molecules). We distinguish between the term "dynamic viscosity" and "kinematic viscosity". The interrelationship between these two is based on multiplication of the relevant substance density.

#### $\eta = v^* \rho$

The below table provides a general overview of conventional media. Viscosity has a major influence on piping design and installation procedures. At a given flow velocity with an increase in fluid friction due to media becoming more viscous, pressure drop in a pipe will rise. Under this condition either the flow velocity will drop or the upstream pressure must be increased to overcome the increased fluid friction. Medium temperature also influences fluid viscosity. With water, the change in viscosity can usually be ignored, but for other media such as oil, pressure losses due to increased viscosity must always be taken into account.

#### Units, dynamic viscosity:

 $[\eta] = 1 \text{ N/m}^2 \cdot \text{s} = 1 \text{ Pa} \cdot \text{s} = 10^3 \text{ mPa} \cdot \text{s} = 10 \text{ Poise} = 10^3 \text{ cP} \text{ (centipoise)}$  $\rightarrow$  1 mPa s = 1 cP

#### Units, kinematic viscosity:

 $[v] = 1 \text{ m}^2/\text{s} = 10^6 \text{ mm}^2/\text{s} = 10^6 \text{ cST}$  (centistoke)  $\rightarrow 1 \text{ mm}^2/\text{s} = 1 \text{ cSt}$ 

Medium/Temp. [°C]	Dyn. viscos. η [cP]	Density ρ [kg/m³]	Kinem. viscosity υ [cST]
Water 20°C	1.01	1000	1.01
Ethanol/20°C	1.19	1580	0.75
Turpentine/20°C	1.46	860	1.70
Juice	2-5	1040	1.93 - 4.8
Milk	5-10	1030	4.85 - 9.7
Glycol/20°C	19.90	1110	17.9
Cream (body lotion)	70-150	1050	66 - 142
Olive oil/20°C	107.50	919	117.00
Detergent 20°C	360.00	1028	350.00
Transformer oil/20°C	986.00	860	1146.50
Thin honey	1000 - 2000	1400	714 - 1428
Ketchup	5000	1430	3496

Viscosity value of conventional media

# Selection Help – Flow Meter Accuracy

#### **Consideration of Measurement Error**

A decision to opt for a specific measuring method usually depends on the required accuracy. Basically, percentages refer either to the measured value or to the full scale value. The maximum measurement error refers to the full scale value and describes the sum of all possibly occurring individual deviations and is frequently shown graphically as a bell-shaped curve. This includes:

- Linearity over the entire measuring range
- Repeat accuracy (referred to the measured value)
- Production-related tolerances
- Installation tolerances as the result of installation in the pipe system.

The production-related tolerances and installation tolerances can be eliminated by field calibration (teach-in), greatly reducing measurement error.

#### Flow meter accuracies with standard K-factor calibration

## Selection Help – Flow Meter Accuracy with Teach In

#### **Teach-in calibration**

Many Bürkert flow devices can be calibrated in line for the precise determination of the K-factor (proportionality factor between pulse frequency and flow rate). "Volume" teach-in calibration involves filling a tank with a defined fluid volume. During this filling operation, the pulses generated by the flow sensor are counted by the electronics. After completion of the filling operation, the value of the filled volume is determined (e. g., with a balance or graduated container) and is entered on the keypad of the transmitter. The device calculates the determined K-factor after the entry has been confirmed. "Flow rate" teach-in calibration involves entering the flow rate of a reference device in the same pipe on the keypad during the operation. The K-factor is calculated after this entry is confirmed.

## Flow meter accuracies with teach-in calibration for paddle wheel and finger magmeter

#### o.F.S. = Full scale (10m/s)

## Selection Help – Pressure Drop

#### **Pressure loss tables**

A pressure loss occurs, dependent on average flow velocity, in the case of fittings and pipes. To estimate the total pressure loss in a piping system it is necessary to be aware of the individual pressure losses. Here the first three diagrams show the pressure loss of the paddle wheel types and Insertion MID types for water/ 20 °C as a function of the nominal diameter and pipe connection.

The pressure loss of the oval gear sensors depends very greatly on the viscosity of the medium while the pressure loss of fluids similar to water is virtually independent of the flow rate with this measuring principle. In more viscous media, the pressure loss increases with increasing viscosity. Likewise, it increases with rising flow velocity. The "Pressure loss, oval gear" diagram shows the pressure loss of an oval gear flow meter 8072 with different media as a function of the flow velocity.

Flow velocity

## Modular Process Connections for Flow

**Process connections for flow measuring instruments** Bürkert distinguishes between two fitting variants in relation to the installation of flow sensors in the process:

- Series S020 for Insertion sensors
- Series S030 for Inline sensors

Both fitting series feature a standard interface to the sensor modules, thus enabling very easy installation and fastening in the system. The special feature of Inline sensors S030 in comparison with Insertion sensors S020 lies in the fact that the electronic modules of the Inline system can be exchanged with no leakage during operation of the process. The measuring sensor is located in the fitting and the measurement signal is transmitted without physical contact (magnetically or optically) to the electronic module. This means that the measuring sensor does not need to be directly connected to the electronics. On the Insertion sensor, the measuring sensor is located in a finger which is immersed into the process. The sensor can be exchanged only after depressurizing the entire system in order to avoid leakage.

#### Insertion fitting system S020

When using Bürkert finger sensors, it is necessary to use type S020 installation fittings of the correct nominal diameter. It is important to ensure that the correct finger length, dependent on nominal fitting diameter, is selected. We distinguish between a short sensor finger and a long sensor finger. Insertion series S020 fittings are available in plastic, brass or stainless steel. They consist of a connector with indentation, a plastic seal and a union nut for fixing the sensor in position. The connector is already permanently connected to a pipe fitting up to DN 50 (2"). A wide range of connection options for installation in a pipe are available (spigot, external thread, weld end, hygienic clamp or flange, etc.). In the case of nominal diameters from 65 to approx. 400 mm, it is advisable to use fusion spigots made of plastic, stainless steel, or a connection saddle made of plastic. Individual connectors which can be welded in (stainless steel) or screwed in (plastic) are recommended for installation in tanks.

#### Inline fitting system S030 and S010

When using Bürkert Inline sensors, it is necessary to use type S030 installation fittings made of plastic, brass or stainless steel. In this series, the measuring sensor (a paddle wheel) is integrated in the fitting and is closed to the outside so that the system is not opened even if the electronic module is detached (no leakage). Signals are transmitted from the paddle wheel to the electronic module magnetically via an induction coil, Hall element or optically by means of infrared.

They consist of a pipe fitting with integrated measuring sensor (paddle wheel or magnetic paddle) and a screwed-on bayonet catch. The corresponding electronic module is inserted in this catch, rotated through 90° and locked with a screw. Series S030 fittings are available in the nominal diameter range from 6 to 50 mm with a variety of connection options for installation in a pipe (threaded port, external thread, weld end, clamp or flange, etc.) as are those in series S020. The type S010 fitting is a special case since it features an integrated paddle - in place of the paddle wheel on the S030. A molded magnet in the paddle triggers a reed contact in the electronic module after being appropriately deflected by the flows dynamic force. The overall dimensions of the S010 are the same as those of the S030. Version S010 was developed for flow switch type 8010. Inline series S030 or S010 fittings are available in plastic, brass or stainless steel.

# Our Level Best

Level measurement is an integral part of process control, and may be used in a wide variety of industries with many different requirements. We can divide level measurement into point level switching/alarming and continuous level monitoring/control.

Point level sensors are used to indicate the level has reached a single discrete liquid height which is a preset level. These sensors can be used to automate an on-off valve to fill liquid into a tank from a low to a high filling point in a tank. For point level we have supplied switches which employ these principles:

– Tuning fork

– Float

The more sophisticated continuous level sensors can provide complete level monitoring of a system. A continuous level sensor, as the name implies, measures the fluid level at all points within the measurement range, rather than at a specific, single point and carries out this task with or without contacting the media.

The continuous level sensor provides an analog output that directly correlates to the distance from the sensor position, the level in the tank and, with some programming, the volume. This analog signal from the sensor may be directly linked to a visual indicator or to a process control loop, forming a level management system.

Discrete sensors are often used in parallel to continuous sensors for overfill or leak positions (HH, LL). Exact level control is a key application for Bürkert as it involves a complete process loop and for continuous level we have supplied transmitters which employ these key principles:

- Ultrasonic
- Radar
- Guided microwave
- Hydrostatic

There is a level meter for every type of liquid in any shaped tank at any temperature. Application knowledge of both the sensor principles and the control loop is therefore the key to success. On the next few pages you will find descriptions of the operating principles behind our level world. Please take full advantage of our expertise by letting us help to design the installation and control the complete loop for you.

## Level Measuring Principles

sensor emits short ultrasonic pulses, at 70 kHz to the measured product. These pulses are reflected by the product surface and received by the transducer as echoes. The running time of the ultrasonic pulses from emission to reception is proportional to the distance and hence to the level. An integrated temperature sensor detects the temperature in the vessel and compensates the influence of temperature on the signal running time. The determined level is converted into an output signal and transmitted as an measured value. If the tank geometry is known, the volume still inside the tank can be indicated. Various disturbance echo filters even enable use in containers with built-in fixtures generating a disturbance echo.

The radar transmitter consists of an electronic housing, a process fitting element the antenna and a sensor. The antenna emits short radar pulses with a duration of approximate 1 ns to the measured product. These pulses are reflected by the product surface and received by the antenna as echoes. Radar waves travel at the speed of light. The running time of the radar pulses from emission to reception is proportional to the distance and hence to the level. The determined level is converted into an output signal and transmitted as an measured value.

High frequency microwave pulses are guided along a steel cable or a rod. When they reach the product surface, the microwave pulses are reflected and received by the processing electronics. The running time is valuated by the instrument and output as distance. Time consuming adjustment with medium is not necessary. The instruments are preset to the ordered probe length. The shortenable rod versions can be adapted individually to the exact requirements.

A fluid column generates a specific hydrostatic pressure as a function of density and filling level. A pressure sensor attached to the bottom of a tank measures this pressure with respect to a reference pressure (generally ambient pressure). Conclusions are then drawn as to the filling level with the aid of the known fluid density. Hydrostatic level measurement is suitable for virtually all types of fluids and produces very precise measured values, dependent on the accuracy of the pressure transmitter.

Restrictions apply to applications in pressurized tanks. In such cases, it is then necessary to also measure this gauge pressure. This can be done by using a second pressure sensor which detects the pressure above the filling level.

A corresponding evaluation unit corrects the measured value of the first pressure sensor on the tank bottom based on this value. The higher the internal pressure of the tank, the lower the share of hydrostatic pressure in the overall pressure, and the level measurement error increases. The measuring accuracy also drops further due to the use of two pressure sensors (addition of the measurement errors). Level 51

A float floating on a fluid changes its vertical position in proportion to the level. A permanent magnet integrated in the float generates a constant magnetic field, thus causing a reed contact in this field to switch. On a float switch, a float with magnet is mechanically connected to a reed contact. This allows a switching contact to be produced for a level. A mechanical stop on the float switch prevents the float rising if the fluid level continues to rise, so that the circuit state does not change. The float moves back out of the switch position only when the fluid level drops below this stop. Restrictions apply to the use of fluids with a low density (lower than 0.7 g/cm<sup>3</sup>) and coating fluids.

The tuning fork is piezoelectrically energized and vibrates at its mechanical resonance frequency of approx. 1200 Hz. When the tuning fork is submerged in the product, the frequency changes. This change is detected by the integrated oscillator and converted into a switching command. The integrated fault monitoring detects the following faults:

- interruption of the connection cable to the piezoelectric elements
- extreme material wear on the tuning fork
- break of the tuning fork
- absence of vibration

# pH and ORP ... Analyse Your World

Water quality is often determined by these important transmitters and in applications like boiler water conditioning, cooling towers, swimming pools or reverse osmosis it is essential.

Analytical expertise combined with our valve history in engineered plastics has made perfect added functionality for simple, accurate pH control for solutions in tanks or Inline.

Our production facility in Triembach, France takes pride in designing and manufacturing both pH/ ORP transmitters and fully functional pH controllers for a continually expanding global client list.

Each pH sensor fits perfectly inside our analytical range and exhibits common interfaces and communication structures which are characterized by similar menus, displays, voltages, and calibration functions.

Factory calibration certificates are always available and materials such as enamel, PVDF, FKM, EPDM and stainless steel are used to ensure long life and chemical compatibility while a wide assortment of electrodes allows deployment into virtually all types of fluids.

## pH/ORP – Measuring Principles

#### pH measurement with glass electrode

The hydrogen ion concentration (pondus hydrogenii or pH value) in an aqueous solution generates a potential difference at a measuring electrode, pH-sensitive glass diaphragm, with respect to a reference electrode (Ag/AgCl). This voltage is measured by a high-impedance pH measuring instrument and converted to a pH value. The relationship between pH value and voltage is linear, with a slope of 59.16 mV/pH. The slope is temperature-dependent and is compensated for by an integrated temperature sensor. Bürkert pH measuring instruments can be used in virtually all fluids on which pH measurement is required, depending on the selection of electrodes. The option of selecting between a compact device with display or a remote version with remote display ensures that the optimum solution is available for virtually any application.

#### pH measurement with enamel electrode

The 8201 pH sensor works as a single-rod measuring cell. The measuring electrode and reference electrode are combined in one element. An enameled steel pipe is used as the basic carrier. The measuring electrode is created by attaching an ion-sensitive enamel layer (yellow) with metallic voltage conductor (metal ring, positioned in the non-conductive blue enamel carrier layer). An ion exchange of H+ ions and Na+ ions takes place on the surface (gel layer) of this enamel layer. The Ag/AgCl reference electrode is located in the interior of the enamel pipe filled with electrolyte. A ground ceramic diaphragm is pressed into the lower end of the pipe. Voltage transfer takes place when the electrolyte makes contact with the measuring solution via the annular gap of the ground diaphragm. A Pt1000 for temperature compensation is also integrated in the sensor. The electrolyte used is 3-molar KCl, stored in a separate electrolyte vessel and permanently connected to the electrode via a small tube. The pressure of the electrolyte vessel is maintained slightly above process pressure.

#### **ORP** measurement

The oxidation-reduction potential electrode measures the potential of a solution on the basis of the presence of specific ions (e.g., CL or O3). It is the tendency of a chemical species to gain or lose electrons at a noble metal electrode. This potential occurs between a metallic measuring electrode (platinum or gold) and a reference electrode (Ag/AgCl). ORP is usually measured in millivolts. It provides information on the oxidizing or reducing capability of the solution. Similar to pH measuring instruments, the same devices can be selected due to the similarities of the +/-2000mV used for both the compact version and remote transmitters and controllers.

Principle of pH-measuring with enamel electrode

Principle of ORP-measuring with glass electrode

#### **Temperature compensation**

The pH of a solution is a function of temperature. If the temperature changes, so does the pH, even though the concentration of the acid or base causing the pH remains constant. With temperature, the sensitivity (voltage change per pH unit) changes. Temperature compensation is a way of converting the pH at the measurement temperature to the pH at a reference temperature. The reference temperature is almost always 25°C (77°F). For example:

- Slope at 25°C (77°F): 59.16 mV/pH

- Slope at 100°C (212°F): 74.04 mV/pH

- This dependence is permanently compensated for with the integrated temperature probe, thus the values are always comparable.

#### Calibration

Electrodes cannot be produced with exactly identical characteristics. Offset and slope will vary with time and manufacturer that produce electrodes with different nominal values. The calibration matches the pH meter to the current characteristics of the electrodes. For this purpose a solution with a precisely known pH has to be used. The calibration process is generally performed by measuring in two different buffer solutions. This enables both offset and slope to be determined. Basically 3 possibilities of calibration procedures are possible: - One-point calibration (only the pH equivalent to the buffer solution is known) offset and slope can not necessarily be determined unless a buffer solution of 7 is use. - Product calibration (calibration with sampling) - Two-point (Offset and slope can be detected)

## Conductivity

Conductivity tells us the amount of dissolved solids there is in a solution and is one of the most important and common analytical measurements in the process environment.

Its applications range from determining the quality of baby food to the prevention of scale in a boiler. It can measure ultra-pure water in a pharmaceutical facility or metal ions in a plating process.

Bürkert understands the broad scope and accuracy requirements of your individual process whether your needs require inductive principles, where no metal contacts the media, or the more common principle where contacting electrodes determine media properties using a direct resistive measurement.

Conductivity is measured by two main principles (conductive and inductive) which are visually explained in in the next pages. Whichever you choose, Bürkert sensors have common electrical and process interfaces with pH/ORP transmitters and controllers. Conductivity, pH and ORP have similar menus, displays, teach-in and volumetric calibration functions and all the materials have been chosen carefully to fit common applications using PEEK and PVDF to ensure long life and chemical compatibility.

## Conductivity – Measuring Principles

Conductivity is a measurement of the ability of a solution to conduct an electric current. For metals the conductivity is given by the electrons. In fluids the number of ions such as metal or salt ions have direct influence to the conductivity. Higher ionic concentration yields higher conductivity. There are basically 2 measuring principles: The conductive principle and the inductive principle. Common to both is that the measuring device produces an alternating electrical voltage between 2 electrodes. Dependending on the conductivity, a direct proportional current flow will be induced. The applied voltage generates a current that is determined by the resistance of the medium (Ohm's law). A second influence to the measured value is the cell constant of the measuring cell itself. The cell constant describes the geometry of the electrodes by distance L between the electrodes and the measuring area A and is defined by its quotients K=L/A. The conductivity of the solution is calculated on the basis of this known cell constant K and by measuring the generated current.

Conductive conductivity - 2 electrode cell

The measuring of the conductivity can be done with 2-electrode cells or 4-electrode cells. The electrodes are in direct contact with the medium. In a traditional 2-pole cell, an alternating current is applied between the 2 poles and the resulting voltage is measured. In order to be able to cover a broad conductivity range, measuring fingers with various cell constants are used. The lower the conductivity, the lower the cell constant must be. The conductivity of ultra-pure water up to concentrated solutions can be measured depending on the cell constant selected. Measuring cells with cell constants K=1, K=0.1 and K=0.01 are available. A PT1000 temperature sensor is integrated for temperature compensation.

Conductive conductivity - 4 electrode cell

In a 4-pole cell, a current is applied to two opposite electrodes (current electrodes) in such a way that a constant potential difference is maintained between the other two electrodes (potential electrodes). As this voltage measurement takes place with a negligible current, these two potential electrodes are not polarized. Having no polarization effect enables the sensor to measure with one cell constant in a very large conductivity range.

Conductive principle, 4-pole electrode

#### Inductive conductivity

An inductive conductivity cell consists of two coils: a field coil and a receiver coil. The coils are integrated in a fingershaped housing. A bore is routed through the finger and the coils are integrated into it. The fluid encloses the finger and flows also through the bore. A sinusoidal AC voltage stimulates the field coil. This produces a current field in the fluid due to the conductivity of the fluid. This current field generates a voltage in the receiver coil. By measuring this voltage and knowing the cell constant, it is possible to determine the conductivity. A temperature sensor is integrated in the tip for temperature compensation to get a highly accurate and reliable 4-20mA output. This measuring method allows use in very problematic fluids. Owing to separation of the medium, all that needs to be ensured is that the housing has adequate resistance if used in such media. Since the measuring electrode has a very broad measuring range, different cell constants are not required. Use of the device is, however, not possible in very pure media since no measured value can be detected below a specific conductivity.

The pressure resistance of plastics drops with increasing medium temperature. This dependence is shown for different sensor types in relation to the plastic materials, temperature and pressure.

#### Pressure / temperature chart for Sensors with Fitting S022

Max. pressure range 8223, 8226, 8205

## Process Connections for pH/ORP and Conductivity

#### Process connections for pH/ORP/Conductivity measuring

Bürkert distinguishes between 2 fitting variants to install the analytical sensors into the process:

- Fitting system S020 with G 2" nut
- Fitting system S022 with standard G1 1/2" thread

#### Insertion fitting system S020

Insertion series S020 fittings are available in plastic, brass or stainless steel. They consist of a connector with indentation, a plastic seal and a union nut for fixing the sensor in position. The connector is already permanently connected to a pipe fitting up to DN 50. A wide range of connection options for installation in a pipe are available (spigot, external thread, weld end, Triclamp or flange, etc.). In the case of nominal diameters from 65 to approx. 100 mm, it is advisable to use fusion spigots made of plastic. Individual connectors which can be welded in (stainless steel) are recommended for installation in tanks.

For detailed information see datasheet Type S020.

## When the Pressure is on

Through our various applications we have assembled a range of pressure sensors which fit both within complete control loops and our customized system solutions.

From biotech to surface technology and from water treatment to the boiler room we cover the applications of our core customers with a complete range of pressure switches and transmitters designed with ruggedness, durability and accuracy in mind.

The measuring instruments output are a standardized 4-20mA or a voltage output and are easily installed, commissioned and calibrated.

Design and materials enable use in virtually all purities, viscosities and temperatures of fluids from ultrapure water to effluent and from molasses to helium in standard, hygienic or explosive environments.

Our diaphragm seals, supplied with relevant certification, protect our instruments from extremely aggressive, toxic, abrasive or high temperature fluids and are appreciated and recognized internationally for more difficult applications.

When integrated with our control valves and PID controllers we can control loops from the pressures associated with tank level measurement to hundreds of atmospheres and our material selection and quality ensures that you have control under pressure.

## Pressure Measuring Principles

Pressure sensors are used for control and monitoring in thousands of everyday applications and are used to indirectly measure other variables such as fluid flow, speed, and level. The pressure transducer translates the mechanical effect of force per unit area by generating a signal as a function of the pressure imposed. This signal, when conditioned and amplified becomes a standard industrial signal such as 4-20mA or 0-10VDC.

The basic transducer is made from a strain gauge which makes use of the changes in resistance that some materials experience due to change in its stretch or strain. Making use of the change in conductivity of material when experiencing different pressures sounds simple but when zero, span, miniturization, linearity, temperature and durability are essential there can be no corners cut. Strain gauge type sensors can vary drastically in technology, design, performance, application suitability and cost.

From the many technologies available we have produced a range of gauge and absolute pressure instruments with accuracies to 0.1% which fit our global customers' requirements from gas handling to steam technologies. Our principles mean that we deliver stable, reliable instruments and control loops to quickly meet your project demands with certificates of calibration and traceability.

#### Explanatory information on measuring range turn-down

Certain pressure measuring instruments allow the nominal pressure measuring range to be turned down to 1/20 (e. g., a nominal range of 0 - 10 bar can be reduced to 0 - 0.5 bar). The accuracy decreases as the turndown factor increases. The following applies as a general rule: -Turn down <= 1/5: No change in accuracy

- -Turn down > 1/5: New accuracy = nominal accuracy x (turn-down factor /5)
- (e. g., turn-down 1/20, nominal accuracy 0.15 %, new accuracy = 0.15 x 20/5 = 0.6 %)

## Hot Ideas and Cool Solutions

Temperature is often cited as the most commonly controlled process variable and it is certainly everyday business for us to help our customers achieve success in their temperature control loops in either heating or cooling systems.

The heat exchange process always relies on accurate temperature monitoring, switching and control. We have integrated thousands of temperature control solutions in factories and on process skids around the world and we understand the intricacies of achieving optimum results.

Our range of temperature sensors, switches and transmitters is configured to provide you peace of mind. As we need to offer long term durability and reliability. The basis for all our temperature measurements is the Pt100 sensor. Stainless steel design enable application in virtually all purities, viscosities and pressures of fluids from simple recycled cooling water to burner gases.

When integrated with our control valves and PID controllers we produce perfect, fast response temperature loops. Inherent modularity ensure you can choose a sensor, a transmitter, a thermowell, a display or a complete control system to meet your most demanding application.

Whether you are cooling an injection molding process or pasteurizing orange juice we can help you realize a hot idea or produce a cool solution.

## **Temperature** Measuring Principles

Resistance temperature sensors (Pt100 technology) is proven in providing the durability necessary in the industrial processes where Bürkert helps its customers. While thermocouples use the Seebeck effect to generate a voltage, resistance thermometers use electrical resistance and require a power source to operate. Resistance thermometry utilizes the temperature dependence of the electrical resistance of metals. The electrical resistance of metals increases with increasing temperature. This Positive Temperature Coefficient (PTC) is well understood in platinum which is why the Pt100 is the basis for our measurements.

In order to measure the resistance of the sensor, the voltage drop across the sensor is measured while a current of 1mA flows through the circuit. This simple two-wire circuit also measures the electrical resistance of the cables and therefore three-wire circuits are normally employed in industrial environments to eliminate this error. Platinum offers high chemical resistance, good reproducibility of the electrical properties and simple processing. The nominal value of a PT100 sensor is 100  $\Omega$  at 0 °C. This raw resistance measurement can be routed right to one of our PID enabled control valves or can be amplified to produce a standard 4-20mA signal or can be used to switch a relay or though hardware onto a fieldbus.

## Transmitters and Controllers

A large range of sensors needs an optimum offering of transmitters and controllers.

Our transmitters take the raw signals from the sensors and amplify or convert them into standard industrial signals or digital information while displaying the process variable as clearly as possible. Our controllers become the heart of reliable loops whether they are positioned at the sensor, in a panel, on a wall or integrated onto a control valve. Its is that flexible and that simple.

With multiple channels, relay outpus and digital communication using RS485, Profibus, and Ethernet as standard we offer solutions for all your process variables. Data logging, process tune, digital calibration, SD card interfaces and specific user friendly programming for cooling towers, boilers and reverse osmosis means we can control pumps or valves, in real time, in any application.

Each device fits inside an architecture arranged around common interfaces and communication structures which are characterized by similar menus, displays, materials and connections. You can decide when to centralize or decentralize intelligence and the interface with our valves is designed to be as simple as possible and complete PID flow loops can be made with just two components.

Simplicity and flexibility from one source.

## Transmitter and Controller Range

#### Type 8611 eCONTROL - Single Channel Universal Controller

Thanks to its compact design, the universal 8611 controller is specially designed for compact control system applications. It is compatible with a wide range of proportional control valves and connects with an electro pneumatic servo-system for pneumatically actuated process control valves. The PI process controller is equipped with many additional functions. The actual process value can be supplied as one of three inputs; a standard current (4-20 mA), frequency or Pt100 signal directly to the universal controller. The process switching points can be set via a 4-20 mA signal or with the keypad.

Bürkert's 8619 transmitter/controller is the latest addition to Bürkert's process control program. The 1/4DIN panel mounted controller incorporates a large backlit LCD display for viewing up to 6 possible process variables dependent on the types of connected types of sensors in a free mix of flow and analytical. Additional input and output modules can be added to further enhance the controller's capabilities with additional 4-20mA and binary inputs and outputs. An SD card is standard for data logging and up/down loading of para-meterization files.

#### ELEMENT Range of Process Controllers

A range of compact positioners and controllers for integrated mounting on pneumatically operated process can either control the loop or transmit process variables to centralized control. All the features of a separate controller or transmitter are ready inside the beautiful new ELEMENT design. Communications through 4-20mA, ASInterface or Profibus are standard allowing these unique valve mount controllers to save you time and money.

#### Type 8619 MultiCELL – Multi-Channel Transmitter/Controller

#### Type 8620 - mxCONTROL

Multi-parameter controller designed to automate the control of rocess variables within a water treatment system (e.g. boiler, cooling tower or reverse osmosis system). Sophisticated electronics and state of the art control algorithms ensure that optimum process control is maintained at all times, with minimal operator intervention. It saves time and space by allowing parameterization and data logging of a wide number of control variants via an SD card slot, USB connection or via an Ethernet interface. Up to eight functions can be performed simultaneously by utilizing up to 23 I/O points.

# Added Value Systems

Bürkert has a unique perspective in the process control and instrumentation industry as we are the only single brand which combines a complete range of valves, instruments, pneumatic actuation, networking and controllers from a single source.

With our dedicated world-class engineers and our superlative manufacturing facilities we can deliver systems which meet your exact requirements.

Your reliable Bürkert sales consultant and our system engineers work in concert to ask the right questions and provide the right hardware. Transparent operations, up to date situation, review procedure, engineering change notices, portals through SAP and secure intranet are normal in our projects.

For a world class system experience, insist on Bürkert people to be part of your next project.

Connect

As a globally flexible, lean, focused and innovative company we are the partner of choice for fluid control systems in more than 35 countries. Whether you are in Stuttgart, Singapore, Chicago or Sydney, everywhere in the world, we are close to you and therefore know at first-hand about your specific tasks and problems.

Following our principle of "one face to the customer", you have a competent, reliable consultant by your side at all times, who listens to your needs and presents a solution in your daily application language ... crossing conventional boundaries and creating synergies between industries in pursuit of your ideal solution.

Systemhaus crews in Charlotte (USA), Suzhou (China), Dresden, Ingelfingen and Dortmund are continuously in innovation mode. They creatively engineer cost effective solutions to meet difficult process challenges for our customers.

## Conceive & Innovate

Your project team starts working for you: from your reliable sales consultant, qualified industry specialists to dedicated system engineers - Bürkert puts the necessary experts together.

For the entire duration of the project they work together, combining their experience and clarifying all the requirements in close cooperation with you to come up with a feasible draft of your solution within the shortest timeframe.

CAD-created animations or simulations. combined with extended manufacturing. materials, tool design, construction and assembly knowledge enable us to provide a rough but firm production concept for your system at an early stage.

## Plan & Specify

In Phase 3 the project is planned in detail. A specification sheet and refined solution concept are developed. This defines exactly what you expect from the system and what it must provide to ensure that all components meet your requirements.

At the end of this phase you are presented with a detailed product definition, a production specification and precise commercial conditions and agreements.

Structured project management based on open communication, effective coordination and thorough documentation ensures fast and reliable results.

## Do & Check

Good communication, coordination and documentation at all project phases make sure that we are on the right track, developing the right solution, to allow us to quickly move on to prototyping.

Thanks to the latest technology, we are able to build a prototype made of metal or plastic or a functional model to test flow for example within 24 hours.

We provide you with samples; we perform tests and, of course, obtain all the necessary local and global approvals to make sure the system can go to production.

From here we work in concert with one of our production facilities in Ingelfingen, Gerabronn, Criesbach, Öhringen or Triembach according to their individual core manufacturing competencies.

## System Solutions 101

Complete

Our work does not end with the perfect delivery of components and systems. We offer a comprehensive program to our global clients interlinking services ranging from maintenance and service contracts, operator training and integrated logistics.

Our customer service is available around the clock, offering support through internet, telephone or our qualified, experienced people at your site.

We aim to provide only the utmost in customer experience. Something you will tell your friends about.
