Safety strap-on thermostat (temperature limiter) for floor heating applications (STB)

The STB Series of universal strap-on thermostats are designed for floor heating applications. They are suitable for use as strap-on, wall-mounted, or (with optional immersion well) immersion thermostat. Devices of the STB Series likewise measure temperature. If the sensor temperature exceeds the set value, a snap-action switch opens, interrupting the electrical circuit, and remains open until reset manually. (Also, if the sensor temperature drops to below approx. - 20 degrees C, the snap-action switch opens, but closes again automatically after the temperature rises again.) To manually reset the device, the sensor temperature must drop by more than approx. 10 K.

Pneumatic Sensor Controller System

This comprises a series of dedicated sensors measuring temperature and humidity and transmitting an industry-standard 0.2 to 1 bar (3-15 psi) signal to controllers. The controllers are available with proportional and proportional plus integral control outputs with or without reset and remote control point adjustment (CPA). These outputs are used to control air conditioning and heating plants. Direct indication of the controlled variable can be provided by a gauge calibrated to match the output of the sensor installed in the tubing of any convenient point.

The RP920 Pneumatic Controllers provide proportional or proportional+integral control of temperature, humidity/or pressure in heating and air conditioning systems depending upon the controller/sensor combination. The construction is of modular design using modern plastic technology providing a high degree of accuracy and reliability, whilst the compact size and rail mounting saves panel space. Compensation and a remote set point facility are available, with either proportional or proportional plus integral output. Gauges can be fitted to indicate the sensor readings and the output pressure. The control output can be selected as either direct or reverse acting to suit the application. The set point scale is 0 to 100% on set point knob. Separate scales for available sensors supplied with controller. Authority is 20 to 300% of main sensor span. Compensation start point is 0 to 100% of compensation sensor span. Integral reset time is 0.5 to 20 min. Proportional Band is 2.5 to 45% of main sensor span.

Applications and Dimensioning

1. GENERAL

Control valves are these devices in an control loop which are, operated by a controller signal, steering the size of energy (using media water or steam).

You find this control devices in most heating, ventilating and air-conditioning systems. The right selection is very important for the controllability of the specified control loop and customer satisfaction.

The control device (valve and actuator) should be selected accordingly to the design requirements of the application and should result in a linear coherence between the output signal and the control variable.

2. DIMENSIONING AND APPLICATION POINT OF VIEW

If the system is to be prepared for connection to a district heating network, space reheaters (radiators, convectors and heating coils) should be connected with 2-way valves, according to system 1 or 2, and dimensioned for water temperatures of 80°C/40°C, at the prevailing outdoor temperature.

In case air reheaters are dimensioned for a return temperature of 50°C, the air heater group must always be connected to the boiler in a bypass configuration, with an automatically controlled 3-way valve. This will ensure a sufficiently high return temperature. If air heaters are to be connected to a district heating network, their temperature and pressure specifications must be suitable for such operation.

If there is no likelihood of later connection to a district heating network, the system should be dimensioned for 80°C/60°C operation, at the prevailing outdoor temperature.

The heaters should be connected with a 2-way valve, in a bypass configuration (system 2), which ensures calculation through the boiler, or with a 3-way valve (system 4). Select the configuration that gives the lowest system cost.

Air reheaters for outdoor air or a mixture of outdoor air and return air should always be fitted with circulation pumps, to prevent freezing. If such air heaters are installed, a freeze protection thermostat should be installed in the lowest water pipe, which, in case of freezing risk, automatically stops the supply air fan and closes outdoor air dampers.

2.1 Characteristic Parameters

K_V - Value

The K_V - value is showing the capacity of media flow of a valve. It characterises the volume flow in [m³/h] of water by measuring a differential pressure of 1 bar.

C_V - Value

In the USA, the C_V - Value is normally used and is related to the volume flow in [gal/min] by having a differential pressure over the valve of 1 [lb/sq in].

$$K_V = 0,86 \cdot C_V \quad / \quad C_V = 1,17 \cdot K_V$$

K_{VS} - Value

By using the K_{VS} - Value, the K_V - Value is related to a Stroke of $H = 100\%$.

K_{vr} - Value

The K_{vr} - Value describes the smallest K_V - Value, where the inclination tolerances of the valve characteristics are just fit.

Rangeability S_v

The rangeability S_v is characterizing the relation between K_{VS} - Value and K_{vr} - Value.

$$S_v = K_{VS} / K_{vr}$$

Calculation with K_V - Value (Medium Water)

$$K_V = V / (\sqrt{\Delta p_v})$$

$$\Delta p_v = (V/k_v)^2$$

$$V = k_v \times \sqrt{\Delta p_v}$$

V = Volume flow in [m³/h]

Δp_v = Differential pressure in [bar]

Applications and Dimensioning

Conversion for other media

$$k_V = V \times \sqrt{\frac{\rho}{\Delta p_v}} \quad \rho = \text{Density in [kg/dm}^3\text{]}$$

In applications where water/glycol mixtures are needed, this is mainly used for heating recovery systems in air/water applications a conversion is needed for the differences in density of the glycol/water mixture. This mixtures are used to reduce the temperature for freezing of the heat exchanger by the outside air.

Attached you find some values for the density of water/glycol mixtures:

2.2 Mixing or diverting valves

As pointed out earlier, 3-way valves are used in order to minimize upsets in pressure and flow balances in the system. In every control circuit there is a mixing and a diverting point. In new constructions, the valve is installed in the mixing point. When renovating old installations, the diverting valve should be retained, if the circuit was so designed originally.

Fig. 1: 3-way valve as a diverting valve

Fig. 2: 3-way valve as a mixing valve

2.2.1 Pressure drop across 3-way valves

The pump pressure and the pressure drop across the 3-way valve are often confused. 3-way valves always have some water path open, which means that the total pressure from the pump does not affect the mixing valve.

Which pressure drop affects the valve plug?

Ignore pressure drops in pipes and pipe bends. Close path B of valve V1. The flow from the diversion point C, through the balancing valve V3 is zero. There can be no pressure drop in this line. This means that the same pressure prevails in diversion point C and at plug B. The flow from point C passes through the load, L and valve port A.

Fig. 3: Pressure drops in typical mixing valve circuit

The valve has been selected, so that its pressure drop will be Δp_A , for a given flow. For the same flow, the pressure drop across the load will be Δp_L .

Applications and Dimensioning

Pressure at plug A: $p_A = p_c - \Delta p_c - \Delta p_A$

Fig. 4: 3-way valve with water path A open

Fig. 5: 3-way valve with water path B open

2.2.2 Pressure drop across the valve plug

$$\Delta P_{plug} = p_B - p_A \rightarrow p_c - (p_c - \Delta p_c - \Delta p_A)$$

$$\Delta P_{plug} = \Delta p_c + \Delta p_A$$

The same reasoning applies, when plug A is closed. The above shows that the 3-way valve is only affected by the pressure drops in the circuit, where the flow is varied by the mixture valve.

The pressure drops that load a 3-way valve is equal to the total pressure drop in the open flow path, calculated from the point at which the flow is divided (C) to the common valve port (AB).

2.3 Valve authority

The valve authority should only be calculated for that part of the circuit, in which the flow is effected by the valve. Thus, the balancing valve V2 in Fig.3 does not effect the valve authority.

The 3-way valve effects the flow in the following parts of the pipe network (marked with thick lines in the figures):

a. Diverting three way valve

Port A: Pipes AC + pressure drop across G.
Port B: CB.

Fig. 6: Diverting three way valve

$$\beta = \frac{\Delta p_V}{\Delta p_V + \Delta p_G + \Delta p_{AC}}$$

b. Mixing three way valve

Port A: Pipes CA + pressure drop across G.
Port B: CB.

Fig. 7: Mixing three way valve

$$\beta = \frac{\Delta p_V}{\Delta p_V + \Delta p_G + \Delta p_{AC}}$$

c. Diverting three way valve

Port A: Pipes AD + CE
Port B: BC

Fig. 8: Diverting three way valve

$$\beta = \frac{\Delta p_V}{\Delta p_V + \Delta p_{AD} + \Delta p_{CE}}$$

d. Mixing three way valve

Port A: Pipes AE + CD.
Port B: BC.

Fig. 9: Mixing three way valve

$$\beta = \frac{\Delta p_V}{\Delta p_V + \Delta p_{AE} + \Delta p_{CD}}$$

For the marked parts the pressure drops in Fig. 8 and Fig 9 are relatively small. The authority of 3-way valves is therefore often close to 1. But to maintain correct characteristic in control valve V, don't select it for a Δp below 3kPa.

4.2 General

When designing HVAC-systems, often uncertainty exists regarding the magnitude of the pressure drop across various components. The following information will suffice for rough estimates, although the manufacturers specifications always should be consulted when making accurate calculations.

Applications and Dimensioning

4.3 Guide for quick estimates

The following are commonly encountered pressure drops:

Δp_p = pressure drop on primary side of heat exchangers.

Δp_s = pressure drop on secondary side of heat exchangers.

Water heater (tap water) $\begin{cases} \Delta p_p = 2 - 7 \text{ kPa}, 20 \text{ kPa}, \text{max.} \\ \Delta p_s = 10 - 30 \text{ kPa}, 50 \text{ kPa}, \text{max.} \end{cases}$

Heat exchanger (radiator network, air conditioning, snow melting) $\begin{cases} \Delta p_p = 20 \text{ kPa}, \text{max.} \\ \Delta p_s = 15 \text{ kPa}, \text{max.} \end{cases}$

Radiators without radiator valves $\Delta p = 0.5 \text{ kPa}$

Low flow systems with radiator $Dp = 10 \text{ kPa}$

Convectors $Dp = 5 - 20 \text{ kPa}$

Fan coils $Dp = 5 - 20 \text{ kPa}$

Heating/cooling coils $\Delta p = 5 - 20 \text{ kPa}$

Boilers single family houses $\Delta p = 1 - 5 \text{ kPa}$

Boilers apartment houses $\Delta p = 0.5 - 10 \text{ kPa}$

Water meter district heating $\Delta p_p = 15 \text{ kPa}$

Filters $\Delta p = 15 \text{ kPa}$

Pipe resistance copper pipe $\Delta p = 0.2 \text{ kPa} / m$

Pipe resistance steel pipe $\Delta p = 0.4 \text{ kPa} / m$

Pipe resistance total in a substation (district heating) $\Delta p = 10 \text{ kPa}$

4.4 Calculations

4.4.1 Example 1

Fig. 25: Example 1

To obtain a flow in the primary circuit of 1.39 l/s a pressure drop of 10 kPa is required. A pressure drop of 100 kPa is available. Calculate the flow coefficient K_v and the authority β of the valve.

Solution

$$p_v = 100 - 10 = 90 \text{ kPa}$$

$$K_v = \frac{36 \cdot q}{\sqrt{\Delta p}} = \frac{36 \cdot 1.39}{\sqrt{90}} = 5.27 \text{ (kPa} \cdot \text{l/s)}$$

$$+40\% = 7.38$$

$$K_v = 5.27$$

$$-20\% = 4.2$$

Select $K_v = 6.3$

Valve authority, β

$$K_v = 6.3 \quad q = 1.39 \text{ l/s}$$

$$Dp_v = 90 \cdot \left(\frac{5.27}{6.3} \right)^2 = 63 \text{ kPa}$$

$$\beta = \frac{63}{100} = 0.63 \quad (\text{a good value as } \beta \text{ should be } > 0.5)$$

Pressure drop to create in the balancing valve

$$DH = Dp_v - Dp_E = 100 - 63 - 10 = 27 \text{ kPa}$$

4.4.2 Example 2

Fig. 26: Example 2

An air preheater must deliver 100 kW.

- Sizing of V.
- Sizing of circulating pump, P.
- Calculate the authority of the valve.

Applications and Dimensioning

Solution

$$P = q \cdot \Delta T \cdot 1.16 \text{ kW}$$

$$100 = q \times (100 - 35) \times 1.16$$

$$q = 1.3 \text{ m}^3/\text{h} = 0.371 \text{ l/s}$$

The pump P should be dimensioned for the flow, $q = 1.3 \text{ m}^3/\text{h}$, and $\Delta p = 20 \text{ kPa}$, plus the remaining pressure drops in the circuit. Select the nearest larger pump and compensate with valve.

4.4.3 Example 3, Control valve V

The pump P provides a constant flow in the secondary circuit and overcomes drops in the secondary circuit. V should be dimensioned for the entire pressure drop, $\Delta p = 100 \text{ kPa}$.

$$K_v = \frac{36 \cdot q}{\sqrt{\Delta p}} = \frac{36 \cdot 0.37}{\sqrt{100}} = 1.33 \text{ (kPa, l/s)}$$

Valve authority, $\beta = 1.0$

Choose right K_v

4.4.4 Example 4, Heating, radiator circuit

Heat demand

50 apartments, each with an average area of 65 m^2 .

A heating demand of 60 W/m^2 gives

$$P = 50 \cdot 65 \cdot 60 = 195 \text{ kW}$$

Similarly, a cellar area of 600 m^2 , with a heating demand of 15 W/m^2 , gives 9 kW .

$$P_{\text{tot}} = 195 + 9 = 204 \text{ kW}$$

4.4.5 Example 5, Radiator valve V1

$$P = q \cdot \Delta T \cdot 1.16$$

$$204 = q \cdot (100 - 50) \cdot 1.16$$

$$q = 3.5 \text{ m}^3/\text{h} = 0.971 \text{ l/s}$$

Pressure drop in the circuit

$$\text{Heat exchanger} \quad \Delta p_p = 35 \text{ kPa}$$

$$\text{Water meter and piping} \quad \Delta p = 25 \text{ kPa}$$

$$\Delta p_v = 150 - 35 - 25 = 90 \text{ kPa}$$

$$K_v = \frac{36 \cdot q}{\sqrt{\Delta p_v}} = \frac{36 \cdot 0.27}{\sqrt{90}} = 3.68 \text{ (kPa, l/s)}$$

$$+40\% = 5.2$$

$$\text{Basic } K_v - \text{value} = 3.68$$

$$-20\% = 2.9$$

Select: $K_v = 4.0$

EQ% (Logarithmic) characteristic.

Valve authority, β

$$\beta = \frac{90}{150} = 0.6$$

Valve close-off pressure

Can the primary valve close off the maximum differential pressure?

Is Δp_c (maximum permissible Δp across a closed valve) lower than the maximum value permitted by the combination of actuator, valve type and valve size? If not, the valve leakage will be excessive ($>0.05\%$ of K_v).

4.5 Explanation Examples

4.5.1 Medium Water

Drawing Line in Fig. 27

Given: -Volume flow $V_{100} = 6.0 \text{ m}^3/\text{h}$

-Pressure drop $\Delta p_v = 0.9 \text{ bar}$ ($= 90 \text{ kPa}$)

Searched for: - k_{vs} - value

The point of intersection of the two drawing lines shows the k_v - value 6.3.

Result: Select a valve with $k_{vs} = 6.3 \text{ m}^3/\text{h}$

4.5.2 Medium Steam

Example A: Drawing Line 1 in Fig. 28

Given: -Max. mass flow of saturated steam $G_S = 370 \text{ kg/h}$

-Primary valve pressure $p_1 = 2.8 \text{ bar}$ (absolute)

-Pressure drop $\Delta p_v = 0.6 \text{ bar}$

Searched for: k_{vs} - value

From the point of intersection of $p_1 = 2.8 \text{ bar}$ with $\Delta p_v = 0.6 \text{ bar}$ move horizontal into the k_v - value area.

Then from the mass flow of saturated steam $G_S = 370 \text{ kg/h}$ move vertically downwards.

The point of intersection with the horizontal and vertical drawing line is between k_v - value 13.7 and 16.

Result: Select a valve with $k_{vs} = 16.0 \text{ m}^3/\text{h}$

Example B: Drawing Line 1 in Fig. 28

Given: -Max. mass flow of superheated steam $G_S = 1300 \text{ kg/h}$

-Primary valve pressure $p_1 = 1.2 \text{ bar}$ (absolute)

-Pressure drop $\Delta p_v = 0.35 \text{ bar}$

-Superheat $\Delta t = 100^\circ\text{C}$

Searched for: k_{vs} - value

From the point of intersection of $p_1 = 1.2 \text{ bar}$ with $\Delta p_v = 0.35 \text{ bar}$ move horizontal into the k_v - value area.

Then from the mass flow of superheated steam $G_S = 1300 \text{ kg/h}$ follow parallel to the lines and move vertically upwards to the point of intersection with the horizontal line for the superheat $\Delta t = 100^\circ\text{C}$.

From this point move vertically upwards.

The point of intersection with the horizontal drawing line shows the k_v - value 100.

Result: Select a valve with $k_{vs} = 100 \text{ m}^3/\text{h}$
