# Inductive BEROs

## Introduction

### Overview

The inductive BEROs are position switches that can be operated without contact, that contain no mechanical parts subject to wear, and that are to a large extent insensitive to environmental conditions.

They are used in applications with stringent requirements for reliability, switch point accuracy, service life, number of switching operations, operating speed, and so on.

### Area of application

Inductive BEROs are the low-cost method for non-contact detection of metal objects. They are used in sectors in which metal components play an important role, e.g.

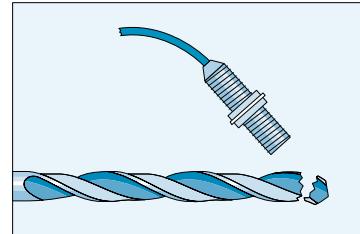

- In the motor industry
- In mechanical engineering
- In the robotics industry
- In conveyor systems and
- In the paper and printing industry

The induction principle and the experience gained by Siemens over many years have made the inductive BEROs what they are: extremely reliable with a very high repeat accuracy and long service life thanks to a lack of wearing parts as well as their insensitivity to temperature, noise, light and water.

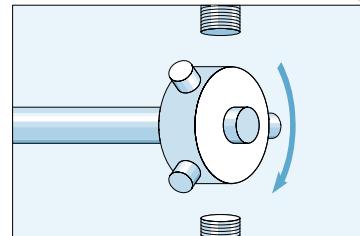

Our customers also benefit from the wide range of inductive BERO proximity switches that Siemens offers. Our complete range meets a wide range of different requirements and leaves no wishes unfulfilled. Inductive BEROs are available

- With operating distances from 0.6 to 75 mm
- In cylindrical and cubic designs
- In the standard version as 3- and 4-wire sensors
- As 2-wire sensors for solid-state inputs
- For extra duty (DC 65 V or AC/DC 320 V)
- To the IP68 degree of protection for extreme environmental conditions
- With increased operating distances
- Without a reduction factor
- As pressure-resistant sensors
- Acc. to DESINA specification
- For direct connection to AS-Interface and
- As intrinsically safe sensors for potentially explosive environments.

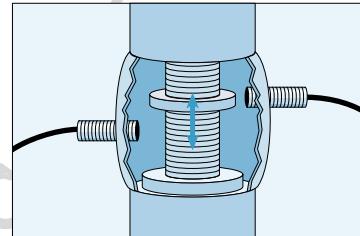

### Application examples

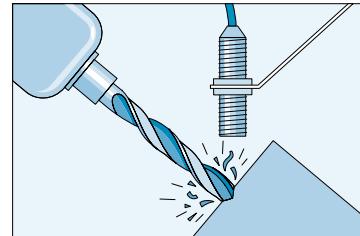

Recognition of broken drills

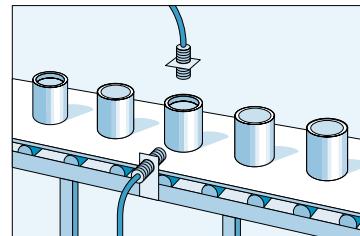

Recognition of setscrews on the wheel for checking of speed or direction

Recognition of valve position (completely open or closed)

Recognition of broken pieces on a mill

Recognition of cans and lids

## Introduction

The inductive BERO proximity switches are classified in accordance with their applications or their technical characteristics:

### BEROs for standard duty

- Rated operating voltage: DC 15 to 34 V (for 3RG46: DC 10 to 30 V)
- Output
  - 3-wire BERO: 1 NO or 1 NC, up to 200 mA,
  - 4-wire BERO: 1 NO and 1 NC (compatible), pnp up to 200 mA
- Operating distance acc. to standard
- The actuation distance is between 0 and 81 % of the rated operating distance.

### BEROs for PLCs (2-wire)

- Rated operating voltage: DC 15 to 34 V
- Output 2-wire BERO: 1 NO, up to 25 mA
- Residual current and voltage drop to suit solid-state inputs
- Operating distance acc. to standard
- The actuation distance is between 0 and 81 % of the rated operating distance.

Advantages:

- Minimum wiring overheads
- Direct replacement of mechanical position switches possible in installations that are not safety-oriented
- Power is supplied from the solid-state input
- npn as well as pnp switching.

### BEROs for extra duty

- Rated operating voltage:
  - 3-wire BERO: DC 10 to 65 V
  - 2-wire BERO: AC/DC 20 to 320 V
- Output
  - 3-wire BERO: 1 NO or 1 NC, pnp, up to 300 mA
  - 2-wire BERO: 1 NO or 1 NC, resistive load up to 300 mA
- The actuation distance is between 0 and 81 % of the rated operating distance.

Advantages:

- Problem-free adaptation to different rated operating voltages
- Insensitive to voltage deviations

### BEROs for extreme environmental conditions (IP69 K)

- Rated operating voltage:
  - 2-wire BERO: AC/DC 20 to 320 V
  - 3-wire BERO: DC 15 to 34 V, DC 10 to 65 V,
  - 4-wire BERO: DC 15 to 34 V
- Output
  - 3-wire BERO: 1 NO or 1 NC, pnp up to 300 mA
  - 4-wire BERO: 1 NO and 1 NC (antivalent), pnp up to 200 mA
- The actuation distance is between 0 and 81 % of the rated operating distance.

Advantages:

- Can be used under extreme environmental conditions according to IP68 by use of a well-sealed enclosure with a special casting compound.

### BEROs with greater operating distance

- Rated operating voltage: DC 10 to 65 V (for 3RG46: DC 10 to 30 V)
- Output 3-wire BERO: 1 NO or 1 NC, pnp up to 300 mA
- Operating distance far above the standard, up to three times the rated operating distance defined in the standard
- The actuation distance is between 0 and 81 % of the rated operating distance.

Advantages:

- Wide range of mounting adjustment
- A smaller type can be selected for the required operating distance
- Reduction of actuation distance is corrected for non-ferrous metals

### U BERO without reduction factor

- Rated operating voltage: 3-wire BERO: DC 10 to 30 V
- Output 3-wire BERO: 1 NO, pnp up to 200 mA

Advantages:

- No reduction factor for non-ferrous metals
- Resistant to magnetic fields, i.e. these BEROs are resistant to welding.  
Resistant to magnetic field up to 160 mT r.m.s. = 21 kA at 25.4 mm;  
except 3RG46 48: 140 mT r.m.s.  
3RG46 44: 140 mT r.m.s.  
3RG46 43: 75 mT r.m.s.

### BEROs pressure-resistant up to 500 bar (7250 psi)

- Rated operating voltage: DC 10 to 30 V
- Output 3-wire BERO: 1 NO, pnp up to 200 mA
- Operating distance: 3 mm.

Advantages:

- Suitable for extreme dynamic mechanical stress
- Easy to install: BERO can be screw fastened against a stop, no adjustment required
- Sensing face seal is gas-tight

### BEROs with analog output

- Rated operating voltage: DC 10 to 30 V
- Output
  - Voltage output DC 0 to 5 V
  - Current output 1 to 5 mA
- Short-circuit protection, inductive interference protection, total reverse polarity protection
- Non-linearized design
- Connection via cable or S12 connector

### Approvals

3RG40, 3RG41 devices with M 12 or M 18 connectors as well as terminal compartments are UL and CSA listed.

For a complete overview, see the Appendix.

### Explosion protection

Approvals for Ex zones 2 and/or 22 according to ATEX on request.

### Personal safety

The use of the inductive BEROs is not permissible for applications in which the safety of persons is dependent on the function of the BERO.

# Inductive BEROs

## Introduction

### Design

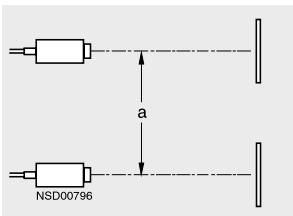

#### Specifications

IEC 60947-5-2, EN 60947-5-2 (VDE 0660, Part 208)

#### Minimum clearance

The proximity switches must not interfere with each other. Therefore a minimum distance **a** must be observed between two sensors.

The distance **a** depends on the sensor size and type (see diagrams in selection tables).

#### Degree of protection

Degree of protection according to IEC 60529.

#### IP67 degree of protection

Where:

6 Protection against the entry of dust. Complete contact protection (electric).

7 Protection against water when the enclosure is immersed in water under given pressure and time conditions. Entry of water in harmful amounts is not allowed.

Test conditions:

- Immersion depth 1 m
- Time 30 min

#### IP68 degree of protection

Where:

6 As above.

8 Protection against water when submerged.

The leak test is based on IEC 60068-2-17, test ql. Contrary to the standard, the tested device is stored in steam and not in water since greater stress exists with this type of storage.

Parameters:

- 7.4 Initial conditions: operating distance at  $T_{amb} = 25^{\circ}\text{C} \pm 5^{\circ}\text{C}$
- 7.5.1 Test liquid: tap water
- 7.5.2 Temperature of test liquid:  $105^{\circ}\text{C} - 5^{\circ}\text{C}$
- 7.5.4 Test pressure: 12 N/cm (1.2 bar)
- 7.5.5 Stress duration: 5 days
- 7.6 Post-treatment: drying at room temperature and cooling. The final measurement is made as soon as the device under test has reached room temperature.
- 7.7 Final measurement: operating distance at  $T_{amb} = 25^{\circ}\text{C} \pm 5^{\circ}\text{C}$ . The permissible change is  $\pm 10\%$  of the initial state.

#### IP69 K degree of protection

Where:

6 As above.

9 K Protection against water with high-pressure jet cleaning. (i.e.: water directed at extremely high pressure onto the enclosure from all directions must not result in harmful effects.)

#### Connectors

For the cylindrical types, 8 mm combined plugs or plugs with M 12 threads are offered as standard (3-pole or 4-pole). A cable plug is additionally required for the plug-and-socket connections, see Accessories.

As an option, plugs with an M 18 thread (3-pole) are also offered for the M 18 and M 30 types.

#### Cables

In general, highly flexible cables with oil-resistant outer sheaths of polyurethane (PUR) are used that are 2 m long as standard.

For applications where cables come into contact with acids or alkalis, please order devices with PVC cables.

For devices used in applications to UL and CSA, PVC cables must be ordered.

See Options for other cable lengths and materials.

#### Cable length

For the BERO proximity switches, long cables cause:

- Capacitive loading of the output
- Increased injection of interference.

Cables should be shorter than 300 m even under favorable conditions.

#### Cable routing

The connecting leads of the proximity switches should not be routed in a cable channel alongside cables that are used to switch inductive loads (e.g. contactor coils, solenoid valves, motors) or that carry the current for solid-state motor drives.

The cable lengths should be kept as short as possible; with favorable routing (small coupling capacitance, small interference voltages), the length may be up to 300 m.

Interference can be reduced by means of the following measures:

- Clearance from interfering cables > 100 mm,
- Shielding
- Connection of coils (of contactors, relays or solenoid valves) with RC elements or varistors.

## Introduction

### Functions

A high-frequency alternating field is generated in the BERO and emerges at the "sensing face". The physical size of this alternating field determines the "range" of the device. When a material that is a good conductor of electricity and/or magnetism comes into close proximity with the sensing surface, the field is damped. Both states (field damped or undamped) are evaluated in the BERO and result in a change in the output state of the switch.

### Built-in protection

The protective circuits built into most BEROs (see selection data) make them easy to handle and protect the devices from damage.

Protection is possible against

- Spurious signals
- Short-circuit and overload (DC)
- Swapped connectors
- Wire-break (connection L- or L+),
- Overvoltage peaks
- Radio interference

### Spurious signal suppression

When the operating voltage is applied, the "damped" status is simulated due to the transient condition of the sensor inductor – even when an activation element is not present. Spurious signal suppression prevents the output switching during this period.

### Short-circuit and overload protection

All DC voltage devices with three-wire and four-wire connections are equipped with short-circuit and overload protection. Short-circuits between the output and the operating voltage connections do not damage the proximity switches, and may occur permanently; an unlimited overload is also permissible. For the duration of the short circuit, the LEDs are not functional.

### Reverse polarity protection

All DC voltage devices with three-wire and four-wire connections are protected against reverse polarity at all connections.

### Wire-break protection

The DC version is designed such that when a wire-break occurs in any connection, the BERO does not output a faulty signal (not for 3RG46 and all 4-wire BEROs). A faulty signal is any non-zero signal that is active for more than 2 ms and whose current is larger than the residual current.

### Inductive interference protection

When inductive loads are disconnected, the output voltage rises (without protective elements) to high values whereby the output transistor can be destroyed. The BERO proximity switches are therefore equipped with a Zener diode at the output which limits the disconnection voltage to a safe value (3-wire BERO).

When inductive loads are connected at currents > 100 mA and simultaneously a switching frequency > 10 Hz, it is recommended that a freewheeling diode is directly connected across the load (due to the power losses in the built-in Zener diode).

### Radio interference protection

The high-frequency susceptibility has been sufficiently reduced to comply with IEC 61000-4-3, Level 3 (testing level 10 V/m).

### Protection against electrostatic charging

The devices are constructed such that electrostatic charging to IEC 61000-4-3, Level 3 (8 kV) does not damage the devices.

### Electromagnetic compatibility (EMC)

All inductive BEROs meet the protection requirements of EMC guideline No. 89/336/ECC. This is verified by application of the standard EN 60947-5-2 and certified by the appropriate authority.

The following EMC standards are applicable for the individual tests:

- EN 55011, IEC-CISPR 11,
- EN 55022, IEC-CISPR 22,
- IEC 61000-4-2, Level 3,
- IEC 61000-4-3, Level 3,
- IEC 61000-4-4, Level 3,
- IEC 61000-4-6,
- IEC 60255-5.

### Displays (LEDs)

Most BEROs are equipped with one or two LEDs.

The yellow LED indicates the operating status:

- BERO with NO function:  
BERO damped = LED lit
- BERO with NC function:  
BERO not damped = LED lit
- BERO with NO and NC function:  
BERO damped = LED lit.

The green LED indicates that the operating voltage is applied. This function is only available in certain devices.

# Inductive BEROs

## Introduction

### Technical specifications

#### General technical specifications

<b>Differential travel <math>H</math></b>	$H \leq 0.2 s_r$
<b>Max. permissible lead length (unshielded)</b>	
• AC	100 m
• DC	300 m
<b>Degree of protection</b>	
• With buried cable	IP67
• With connector and cable plug	IP67
• With wiring space	IP65
• BERO for extreme environment	IP68 or IP69 K
• No reduction factor	
- With brass enclosure	IP67
- With stainless steel enclosure	IP68
<b>Ambient temperature</b>	
• During operation	-25 ... +85 °C <sup>1) 2)</sup>
• During storage	-40 ... +85 °C <sup>1)</sup>
<b>Shock resistance</b>	30 $\times g$ , 18 ms duration
<b>Resistance to vibration</b>	55 Hz, 1 mm amplitude
<b>Reduction factor</b>	
• BERO for flush/non-flush mounting (typical values)	
- Stainless steel	0.7 ... 0.9
- Aluminum	0.35 ... 0.5
- Copper	0.2 ... 0.4
- Brass	0.3 ... 0.6
• U BERO	1
<b>Voltage drop</b>	
• 2-wire BERO	≤ 8 V
• 3-wire BERO	≤ 2.5 V
• 4-wire BERO	≤ 2.5 V

- 1) Up to +70 °C with 3RG41 and 3RG46.  
 2) Maximum switching current for three-wire BEROs for standard duty at operating temperatures >50 °C is 150 mA.

### Fastening nuts

Design	Material	Tightening torque nm
M 8	Brass	2
	Stainless steel	5
M 12	Brass	10
	Molded plastic	1
	Stainless steel	25
M 14	Molded plastic	0.5
M 18	Brass	20
	Molded plastic	3
	Stainless steel	50
M 30	Brass	40
	Molded plastic	5
	Stainless steel	100

### Options

#### Longer connection lines

The 3RG40 and 3RG41 inductive BEROs are available with longer connection lines (PUR). The minimum ordering quantity in this case is 10 units.

The 3RG46 inductive BEROs are also available with a longer connection line. The minimum ordering quantity in this case is 50 units. Delivery time on request.

The Order No. must be supplemented by **"-Z"** and the Order code added for the desired length:

#### Up to 9.9 m in steps of 0.1 m:

Length	Order code
1.0 m	<b>A 10</b>
2.1 m	<b>A 21</b>
9.9 m	<b>A 99</b>

Note: these data do not apply to the standard version with a cable length of 2 m or 3 m.

#### 10 m and above in steps of 1 m:

Length	Order code
10 m	<b>B 10</b>
99 m	<b>B 99</b>

**Example:** 3RG40 12-0AB00-Z  
**B 10**

#### Stainless steel enclosure

Many 3RG4 cylindrical inductive BEROs (from M 12 upwards) with brass enclosure are also available in stainless steel.

Delivery possibilities on request.

#### Extended temperature range

The 3RG40 BEROs are available for an operating temperature of -40 to +85 °C or -25 to +100 °C.

Delivery possibilities on request.

#### Special cables

The 3RG40 and 3RG41 inductive BEROs (3RG46 on request) are also available with other types of cable; see table below.

BERO	Type of conductor	Outer diameter mm	Permissible conductor cross-section mm <sup>2</sup>
2-wire	LiYY11Y (PUR)	4.5	2 × 0.25
	PVC	4.5	2 × 0.56
3-wire	LiYY11Y (PUR)	4.5	3 × 0.25
	PVC	4.8	3 × 0.56
	PVC (oil-resistant)	4.6	3 × 0.25
	Teflon	4.0	3 × 0.55
	Silicone	5.5	3 × 0.25
4-wire	LiYY11Y (PUR)	4.5	4 × 0.14
	PVC	5.3	4 × 0.34
	PVC (oil-resistant)	4.6	4 × 0.14
	Teflon	4.3	4 × 0.55

The Order No. must be supplemented by **"-Z"**, and the required type of cable and length specified in plain text.

Delivery possibilities on request.

# Inductive BEROs

## Introduction

### Typical circuits

#### Parallel connection

##### DC voltage version

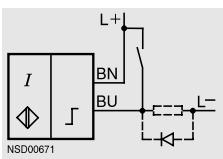

###### 2-wire BEROs, for PLCs

Not possible since the total of all BERO off-state currents must be smaller than the holding current of the load

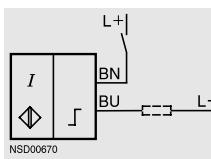

#### Series connection<sup>1)</sup>

Not possible since  
 $n \leq \frac{U_b - 15 \text{ V}}{8 \text{ V}}$   
 $U_b \text{ PLC: } 24 \text{ V}$

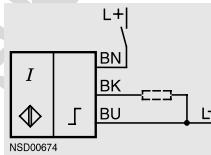

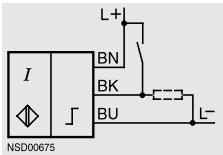

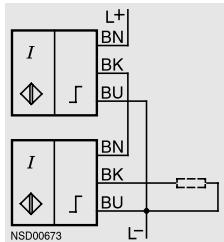

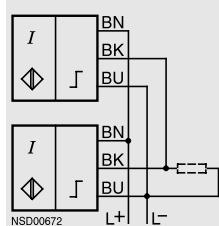

#### Parallel connection with 1 contact (NO or NC)

#### Series connection with 1 contact (NO or NC)<sup>1)</sup>

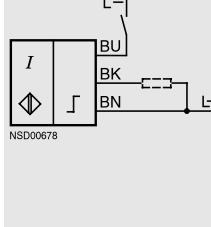

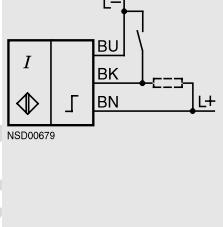

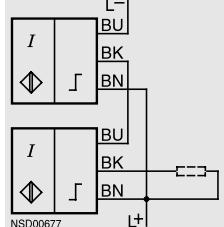

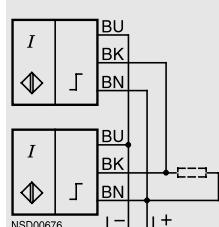

#### 3-wire BEROs, pnp

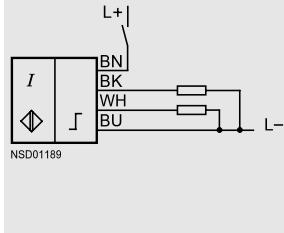

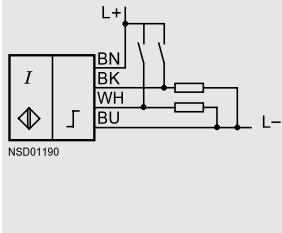

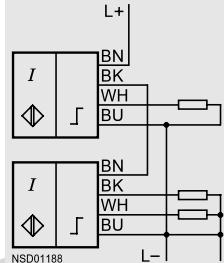

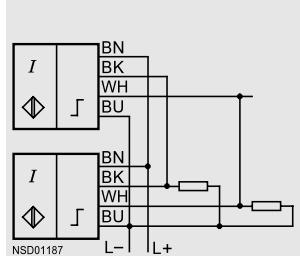

Other connections not permissible.

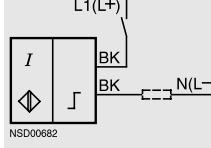

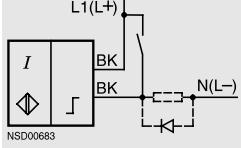

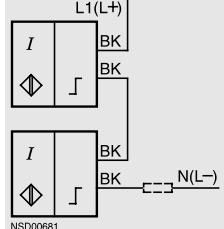

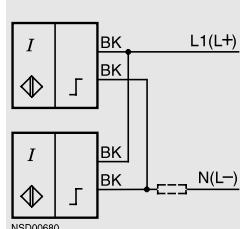

#### 3-wire BEROs, npn

#### 4-wire BEROs, pnp

#### AC/DC version

The total of all BERO off-state currents must be smaller than the holding current of the load

$n \leq \frac{U_b}{20 \text{ V}}$   
 $U_c = U_b - (n \cdot 8 \text{ V})$

With DC voltage operation, a diode must be connected in parallel to the primarily inductive load.

$U_b$  = operating voltage

$U_c$  = minimum actuating voltage of load

$n$  = number of BEROs

$U_{\min}$  = minimum permissible operating voltage

- 1) The power-up delay of the sensors must be considered when determining the switching times.

Abbreviations for the color coding of the connection cables according to IEC 60757:

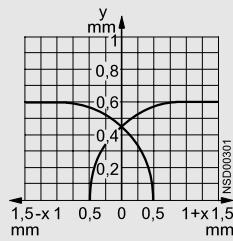

BK = black      BN = brown  
 BU = blue      WH = white

### Characteristics

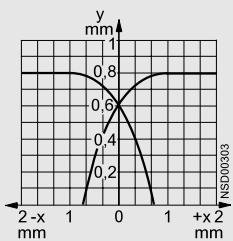

#### Response curves

The response curves are determined using standard targets according to EN 60947-5-2.

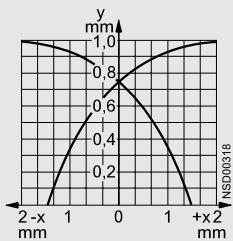

Oper. distance 0.6 mm (normal)  
3RG46 00, 46 03, 46 10

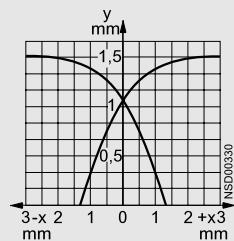

Oper. distance 0.8 mm (normal)  
3RG 46 .0, 3RG 46 36

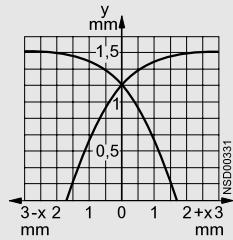

Operating distance 1 mm (normal)  
3RG40 11

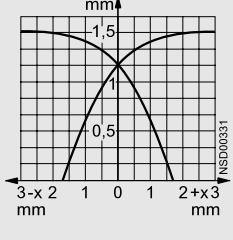

Oper. distance 1.5 mm (normal)  
3RG40 ...-33 (shorty)

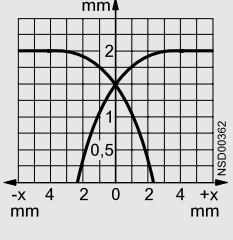

Operating distance 1.5 mm (normal)  
3RG40 ...-05,  
3RG46 01, 3RG46 11, 3RG46 37

## Introduction

### Further information

#### BERO lexicon

Terms associated with the technology of proximity switches are explained below. Some of the terms are defined in IEC 60947-5-2.

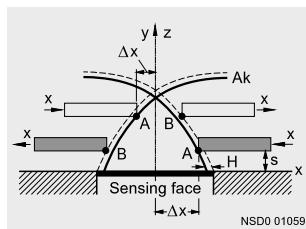

#### Active surface

The active surface of an inductive proximity switch is the surface through which an electromagnetic field is emitted (IEC).

The corresponding activation element (target) is moved toward this surface to trigger a switching process.

#### Response curve

The line on which all response points A for a BERO can be found. The curve has been determined using the standard target. The sensor-related characteristics can be obtained from it. The BERO axis z coincides with the y axis.

- 5
- Ak Response curve
  - A Response point
  - B Release point
  - H Differential travel
  - s Operating distance
  - x Direction of movement
  - $\Delta x$  Axial distance to target
  - y Distance from BERO
  - z Reference axis

#### Response point A

The position of the actuating element when the signal is output. The reference point is the bottom front edge of the actuating element.

#### Response delay $t_A$

The response delay is the duration which the switching element requires for response when the target enters or leaves the sensing range (IEC).

The value is measured at  $s = 0.5 \times s_n$ .

#### Non-equivalence

The 4-wire BEROs have two outputs:

- $A_1$  with NO function and
- $A_2$  with NC function.

#### Tightening torque

Excessive tightening of the nuts could mechanically damage the BERO proximity switches. The maximum permissible torques are specified in the Technical specifications.

#### Switching frequency $s_a$

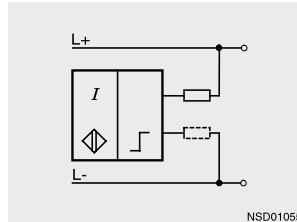

See operating distances

#### Axial distance to target $\Delta x$

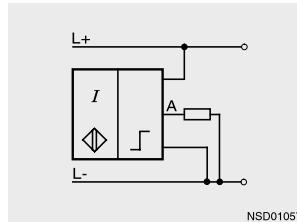

Distance between the actuating element and the BERO axis z at the response point A.

### Output

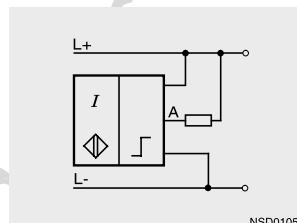

The BERO proximity switches are available with different output connections.

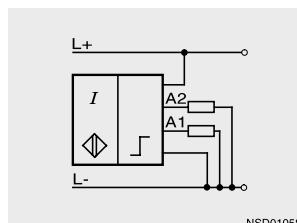

2-wire, DC or AC/DC, load connected in series with BERO

3-wire, DC, pnp, load connected between A and L-

3-wire, DC, npn, load connected between A and L+

4-wire, antivalent, DC, load connected between A<sub>1</sub>, A<sub>2</sub> and L-

#### Output resistance

The BERO proximity switches have a built-in output resistance so that the output voltage can follow the switching status even without an external load. A load resistance must be connected when operating with high switching frequencies (to reduce the electric time constant).

#### Axial approach

Axial approaching of the target is where its center point is located in the reference axis (IEC).

#### Rated operational current $I_e$ (output current)

The sensors are designed for a specific maximum output current. If this current is exceeded, even briefly, the built-in overload protection will be activated. Incandescent lamps, capacitors and other strongly capacitive loads (e.g. long leads) have effects similar to an overload.

**Power-up delay  $t_v$** 

Duration between switching on the power supply and the beginning of the proximity switch's operational readiness (IEC). See also spurious switch-on pulse.

**Operating voltage**

The operating voltage is specified including 10% residual ripple.

**Operating temperature**

The specified operating temperature range must not be exceeded. The proximity switch could then be damaged, and the operating response is undefined.

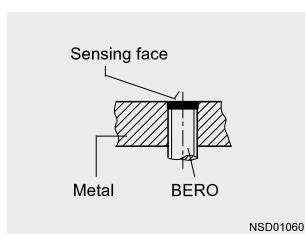

**Reference axis z**

Axis running perpendicular to the active surface and through its center (IEC). See also mounting instructions.

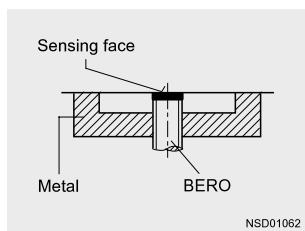

**Mounting**Embeddable proximity switches

A proximity switch is embeddable if any attenuating material (metal) can be attached around the active surface without influencing the characteristic features (IEC).

To ensure perfect functioning, a gap should be left in front of the active surface.

Non-embeddable proximity switches

A proximity switch is non-embeddable if a certain free zone is required around its active surface in order to retain the characteristic features (IEC).

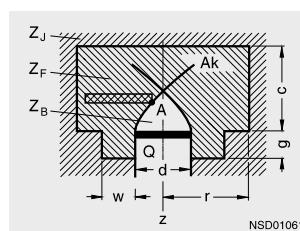

Quasi embeddable proximity switches

A proximity switch that is quasi embeddable also requires a certain free zone. However, flush mounting is permissible in non-attenuating materials.

**Free zone**

Range around the proximity switch which must be kept free of materials which interfere with the characteristic features of the switch (IEC).

The volume of the free zone is defined by the dimensions r, c and w, g (see graphic).

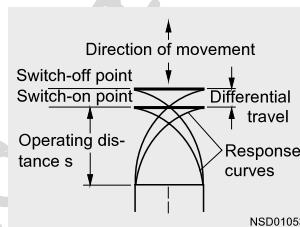

Ak	Response curve
A	Response point
c, g	Partial heights of transition region
d	BERO diameter
Q	Active surface
r	Radius of free zone
w	Mounting condition
z	Reference axis
Z <sub>B</sub>	Attenuation zone
Z <sub>F</sub>	Free zone
Z <sub>J</sub>	Inactive zone

**Differential travel H**

Distance between the switching points when the target approaches or is removed from the proximity switch (IEC).

The differential travel causes a defined switching response for the devices. The switching distance always refers to the switch-on point.

**Smallest operating current  $I_m$  (minimum load current)**

The current required to retain the conductivity of the switching elements in the ON state (IEC). This applies to 2-wire BEROs.

**Magnetic fields**

Permanent magnetic fields and low-frequency alternating fields do not generally influence the function of the proximity switches. Strong fields may saturate the ferrite core of the switch and thus increase the operating distance or switch the device. On the other hand, damage is not probable.

High-frequency fields with frequencies of several hundred kHz can considerably interfere with the function (operating frequency of the sensors). Shielding is recommended in the event of difficulties with interference fields.

**Target (actuating element)**

Parts made of metal with which BEROs are actuated in service. Form, material and dimensions influence the response characteristic of the BERO (see reduction factors).

The specified rated operating distances  $s_n$  were determined using the minimum surface defined in the standard (see characteristic). The usable operating distance  $s_u$  is reduced if the surface is less than the minimum.

**Power supply units**

Single-phase power supply units must be smoothed with at least 1000  $\mu\text{F}/\text{A}$ . For noise suppression reasons, this measure is also necessary with three-phase power supply units.

# Inductive BEROs

## Introduction

### Standard target

The standard target is a defined part used for comparison measurements of the operating distances and sensing ranges (IEC).

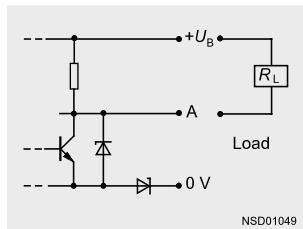

Material of standard target: St 37, 1 mm thick

Dimensions of square standard target: the side length is equal to

- the diameter of the inscribed circle on the active surface of the BERO or
- three times the rated operating distance  $s_n$  if  $3 \times s_n$  is greater than the diameter of the inscribed circle.

### pnp connection

The output stage contains an npn transistor which connects the load to the negative operating voltage (0 V). The load is connected between the output and the positive operating voltage ( $+U_B$ ).

### Resistance to oil

The proximity switches with degree of protection IP67 are not suitable for permanent operation in an environment containing oil. The following must therefore be observed:

#### Lubricating oils

Usually present no problem.

#### Hydraulic oils, cutting oils

These attack most plastics. In particular, the PVC lines become discolored and brittle.

Measures: avoid contact with these liquids if possible, especially on the active surface.

### Parallel connection

Parallel connection of proximity switches to implement logical functions is possible with 3-wire and 4-wire BEROs without problem, but not with 2-wire BEROs.

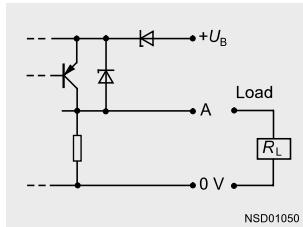

Please note:

- The power consumption increases.
- Leakage currents add up so that an impermissible voltage drop may occur at the load even in the off state.

See graphics, page 5/12.

### pnp connection

The output stage contains a pnp transistor which connects the load to the positive operating voltage ( $+U_B$ ). The load is connected between the output and the negative operating voltage (0 V).

### Programming

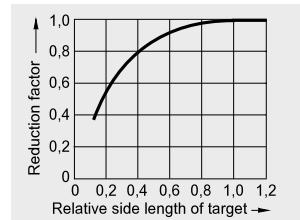

Selection of NO or NC function using slide switch in bottom part of enclosure or plug-in jumper in the electronics base. Only with certain cubic BEROs.

### Reduction factors

The specified operating distance  $s$  refers to exactly defined measuring conditions (see operating distance). Reduced operating distances usually result with other arrangements. The reduction factors (see Technical specifications) are only approximate values. Deviations may result depending on different alloys and the type.

### Influence of geometry

If a smaller target is used than the standard target defined in IEC 60947-5-2, the operating distance must be corrected by a reduction factor.

### Series connection

See graphics, page 5/12.

### Residual voltage

The residual voltage is the voltage measured across the load with the output disabled.

### Residual current $i_r$

The residual current is the current which flows in the load circuit of the proximity switch in the disabled condition (IEC).

It is used to retain the function, and must primarily be observed with parallel connections.

### Residual ripple $\sigma$

The maximum value of the residual ripple from peak to peak must not exceed 10% of the rated voltage  $U_n$ . The switching response may be undefined if the residual ripple is large. Correction is possible using a larger smoothing capacitor or a regulated power supply.

### Release point B

The position, e.g. in the attenuation zone, at which the bottom rear edge of the actuating element is located at the moment the signal changes when removing.

### Operating distance

The operating distance is the distance at which a change in signal is caused at the output when the target approaches the active surface along the reference axis (IEC).

Measurement of the operating distance is carried out according to IEC 60947-5-2 using a standard target and axial approach.

### Rated operating distance $s_n$

The rated operating distance is a conventional variable for defining the operating distances. Neither specimen scatter nor changes resulting from external influences such as voltage or temperature are taken into account (IEC).

This operating distance applies when using the standard target according to IEC 60947-5-2. Reduction factors must be considered if the material and/or size of the target differ from those of the standard target.

## Introduction

### Real operating distance $s_r$

Operating distance of a particular proximity switch measured at defined temperature, voltage and mounting conditions (IEC).

This is the operating distance for a particular switch measured according to IEC 60947-5-2. The manufacturing tolerance is 10%:

$$0.9 s_n < s_r < 1.1 s_n$$

### Usable operating distance $s_u$

Operating distance of a particular proximity switch measured under defined conditions (IEC).

This includes the additionally expected deviations caused by the variations in temperature and operating voltage within the specified ranges.

The usable operating distance is between 90 % and 110 % of the real operating distance. This results in the following for a reliable design:

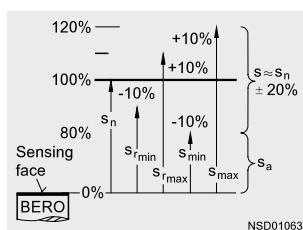

$$0.81 s_n < s_u < 1.21 s_n$$

### Ensured operating distance (actuation distance) $s_a$

Distance from the active surface at which actuation of the proximity switch is ensured under defined conditions (IEC).

The ensured operating distance is between zero and the bottom value of the useful operating distance:

$$0 < s_a < 0.81 s_n$$

$s_a$  Actuation distance

$s_n$  Rated operating distance

$s_r$  Real operating distance

$s_{min}$  Min. usable operating distance  $s_u$

(= operating distance  $s_a$ )

$s_{max}$  Max. usable operating distance  $s_u$

### Switching element function

#### NO function

An NO function results in a flow of load current when the target is sensed, and no flow of the load current when the target is not sensed (IEC).

#### NC function

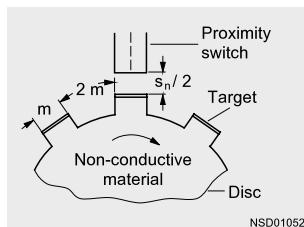

An NC function results in no flow of load current when the target is sensed, and a flow of load current when the target is not sensed (IEC).

### Switching frequency f

Number of switching operations of a proximity switch within a defined time interval (IEC).

The switching frequency is the maximum possible switching rate between the damped and non-damped statuses at which the output circuit still delivers a defined signal sequence corresponding to the activation.

It specifies the maximum permissible number of pulses per second at a constant pulse : pause ratio of 1 : 2 and half the rated operating distance  $s_n$ . The measurement is carried out according to IEC 60947-5-2.

### Welding-resistant

Sensors which can be used in strong magnetic fields, e.g. during arc welding, or in fields of electrolysis plants.

The maximum permissible value is specified for specially selected sensors, e.g. U BERO.

### Lateral approach

Lateral approach of the target is at right angles to the reference axis (IEC).

### Voltage drop

A voltage drop (dependent on the current) occurs across the output transistor in the conductive state; the output voltage does not quite reach the associated operating voltage (to be particularly observed with a series connection and electronic inputs).

### Current input

The current input is understood to be the current consumption of the proximity switch required to operate the oscillator, amplifier etc. It does not include the current flowing through the load.

The no-load current  $I_0$  is the current drawn from the power supply without a load being connected.

### Temperature drift

The specified operating distances refer to an ambient temperature of 20 °C. Within the permissible temperature range of -25 to +70 °C, the operating distance varies by max. ±10% compared to the value at 20 °C.

The temperature of the target alone has practically no influence on the operating distance.

### Repeat accuracy R

The repeat accuracy is the change in the real operating distance  $s_r$  at defined conditions (IEC).

The repeat accuracy is measured over a period of 8 hours at an ambient temperature of 23 °C (± 5 °C), any relative humidity within the specified range, and a defined supply voltage.

The difference between any two measurements must not exceed 10 % of the real operating distance  $s_r$ . The repeat accuracy is usually far better in the case of measurements immediately following one another.

### Mounting instructions

A = active surface  
B = metal-free area

The active surface can be adjusted in 5 directions.

The active surface can be adjusted in 5 directions. With screwed sensor.

The active surface can be adjusted in 5 directions. With rotatable connector.

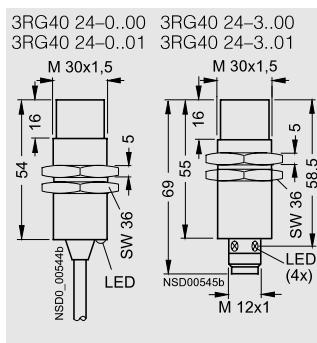

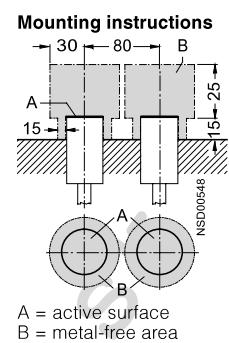

Operating distance 15 mm

**Technical specifications**

Class	Normal (PLC)		Extra duty (DC 65 V)		Extra duty (AC/DC)
